A coupling reaction similar to pinacol coupling has been used with imines, which dimerize to give 1,2-diamines. A number of reagents have been used, including treatment with $TiCl_4$—Mg,[1692] In/aq. EtOH,[1693] Zn/aq. NaOH,[1694] Cp_2VCl_2/Zn/

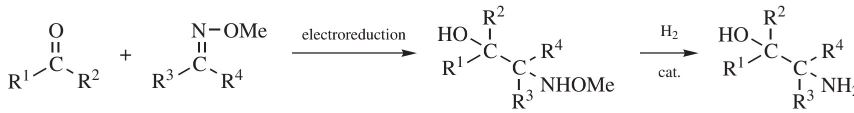
$PhMe_2SiCl$,[1695] Et_2AlCl,[1696] SmI_2,[1697] and (for silylated imines) $NbCl_4(thf)_2$.[1698] When electroreduction was used, it was even possible to obtain cross-products, by coupling a ketone to an *O*-methyl oxime:[1699] *O*-Methyl oxime ethers are coupled to give 1,2-diamines using Zn and $TiCl_4$.[1700] Aldehydes are converted to 1,2-diamines by treatment with TMS_2NH, NaH, and Li metal in 5 *M* $LiClO_4$ in ether, with sonication.[1701] Hemiaminals are coupled to give 1,2-diamines with TiI_4/Zn.[1702] Amides are converted to 1,2-diamines with Cp_2TiF_2 and $PhMeSiH_2$.[1703] Samarium(II) iodide was used to couple iminium salts, giving the 1,2-diamine.[1704] Ketones can be treated with Yb, and then an imine to give amino alcohols.[1705]



The *N*-methoxyamino alcohol could then be reduced to the amino alcohol.[1699] A photochemical coupling has also been reported.[1706] A variation of this reaction treats an imine with Yb in THF/HMPA and then an aldehyde to give a 1,2-bis(imine).[1707]

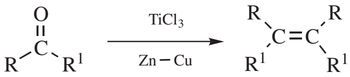
19-77 Bimolecular Reduction of Aldehydes or Ketones to Alkenes

De-oxygen-coupling



Aldehydes and ketones, both aromatic and aliphatic (including cyclic ketones), can be converted in high yields to dimeric alkenes by treatment low valent titanium,[1708] initially generated with $TiCl_3$ and a zinc–copper couple.[1709] This is called

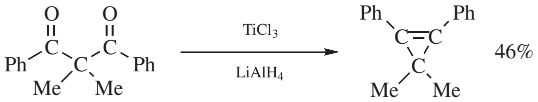
the *McMurry reaction*.[1710] The reagent produced in this way is called a *low-valent titanium reagent*, and the reaction has also been accomplished[1711] with low-valent titanium reagents prepared in other ways, for example, from Mg and a $TiCl_3$–THF complex,[1712] from $TiCl_4$ and Zn or Mg,[1713] from $TiCl_3$ and $LiAlH_4$,[1714] from $TiCl_3$ and lamellar potassium graphite,[1715] from $TiCl_3$ and K or Li,[1716] as well as with $ZnMe_3SiCl$[1717] and with certain compounds prepared from WCl_6 and either lithium, lithium iodide, $LiAlH_4$, or an alkyllithium[1718] (see **17-18**). The reaction has been used to convert dialdehydes and diketones to cycloalkenes.[1719] Rings of 3–16 and 22 members have been closed in this way, for example,[1720]



The same reaction on a keto ester gives a cycloalkanone.[1721]

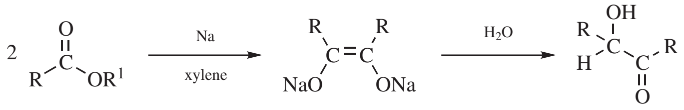
Indoles have been prepared form ortho-acyl amides with Ti(powder) and Me_3SiCl[1722] or with $TiCl_3$—C_8K.[1723] Benzofurans have been prepared by a closely related reaction.[1724]

Unsymmetrical alkenes can be prepared from a mixture of two ketones in a cross-coupling reaction, if one is in excess.[1725] An aldehyde and a ketone were cross-coupled using $Yb(OTf)_3$, for example.[1726] The mechanism consists of initial coupling of two radical species to give a 1,2-dioxygen compound (a titanium pinacolate), which is then deoxygenated.[1727]

OS **VII**, 1.

19-78 Acyloin Ester Condensation



52

When carboxylic esters are heated with sodium in refluxing ether or benzene, a bimolecular reduction takes place, and the product is an α-hydroxy ketone (called an acyloin).[1728] The reaction, called the *acyloin ester condensation*,[1729] is quite successful when R is alkyl. Acyloins with long chains have been prepared in this way, for example, R = $C_{17}H_{35}$, but for high-molecular-weight esters, toluene or xylene is used as the solvent. Modifications to this procedure have been reported, including an ultrasound-promoted acyloin condensation in ether,[1730] which imporvied the yields of four-, five-, and six-membered rings, and Olah's procedure, which was also done in ether.[1731]

The acyloin condensation has been used with great success, in boiling xylene, to prepare cyclic acyloins from diesters.[1732] The yields are 50–60% for the preparation

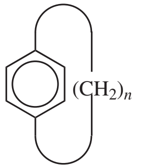
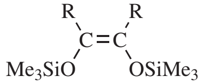
of 6- and 7-membered rings, 30–40% for 8- and 19-membered, and 60–95% for rings of 10–20 members. Even larger rings have been closed in this manner. This is one of the best ways of closing rings of 10 members or more. The reaction has been used to close 4-membered rings,[1733] although this is generally not successful. The presence of double or triple bonds does not interfere.[1734] Even a benzene ring can be present, and many paracyclophane derivatives (**53**) with $n = 9$ or more have been synthesized in this manner.[1735]





53 **54**

Yields in the acyloin condensation can be improved by running the reaction in the presence of chlorotrimethylsilane Me_3SiCl, in which case the dianion **52** is converted to the bis silyl enol ether **54**, which can be isolated and subsequently hydrolyzed to the acyloin with aqueous acid.[1736] This is now the standard way to conduct the acyloin condensation. Among other things, this method inhibits the Dieckmann condensation[1737] (**16-85**), which otherwise competes with the acyloin condensation when a five-, six-, or seven-membered ring can be closed (note that the ring formed by a Dieckmann condensation is always one carbon atom smaller than that formed by an acyloin condensation of the same substrate). The Me_3SiCl method is especially good for the closing of four-membered rings.[1738]

The mechanism is not known with certainty, but it is usually presumed that the diketone RCOCOR is an intermediate,[1739] since small amounts of it are usually isolated as side products, and when it is resistant to reduction (e.g., *t*-Bu—COCO—*t*-Bu), it is the major product. A possible sequence (analogous to that of **19-76**) is

[1739]Another mechanism, involving addition of the ketyl to another molecule of ester (rather than a dimerization of two ketyl radicals), in which a diketone is not an intermediate, has been proposed: Bloomfield, J.J.; Owsley, D.C.; Ainsworth, C.; Robertson, R.E. *J. Org. Chem.* ***1975***, *40*, 393.

A large surface area for the sodium is usually required for good results in this coupling, consistent with a surface reaction. In order to account for the ready formation of large rings, which means that the two ends of the chain must approach each other even although this is conformationally unfavorable for long chains, it may be postulated that the two ends become attached to nearby sites on the surface[1740] of the sodium. Although high dilution techniques are not always necessary, effective stirring (high speed stirrer at 2000–2500 rpm) is usually required to generate "sodium sand". Highly pure sodium gives poorer results, and a small percentage of potassium is important. Up to 50% potassium (1:1 Na/K)[1741] has been used in acyloin condensations.

In a related reaction, aromatic carboxylic acids were condensed to α-diketones (2ArCOOH → ArCOCOAr) on treatment with excess Li in dry THF in the presence of ultrasound.[1742]

The acyloin condensation was used in an ingenious manner to prepare the first reported catenane (see p. 131).[1743] This synthesis of a catenane produced only a small yield and relied on chance for threading the molecules before ring closure.

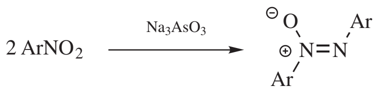
19-79 Reduction of Nitro to Azoxy Compounds

Nitro-azoxy reductive transformation



Azoxy compounds can be obtained from nitro compounds with certain reducing agents, notably sodium arsenite, sodium ethoxide, NaTeH,[1744] $NaBH_4$–PhTe-TePh,[1745] and glucose. The most probable mechanism with most reagents is that one molecule of nitro compound is reduced to a nitroso compound and another to a hydroxylamine (**19-46**), and these combine (**12-51**). The combination step is rapid compared to the reduction process.[1746] Nitroso compounds can be reduced to azoxy compounds with triethyl phosphite or triphenylphosphine[1747] or with an alkaline aqueous solution of an alcohol.[1748]

19-80 Reduction of Nitro to Azo Compounds

N-De-bisoxygen-coupling

$$2\,ArNO_2 \xrightarrow{LiAlH_4} Ar{-}N{=}N{-}Ar$$

Nitro compounds can be reduced to azo compounds with various reducing agents, of which $LiAlH_4$ and zinc and alkali are the most common. A combination of triethylammonium formate and lead in methanol is also effective.[1749] With many of these reagents, slight differences in conditions can lead either to the azo or azoxy (**19-79**) compound. By analogy to **19-79**, this reaction may be looked on as a combination of ArN=O and $ArNH_2$ (**13-24**). However, when the reducing agent was $NaBH_4$,[1750] it was shown that azoxy compounds were intermediates. Nitroso compounds can be reduced to azo compounds with $LiAlH_4$. Dicarborane, with a catalytic amount of acetic acid, reduces aromatic nitro compounds to the amine.[1751]

Nitro compounds can be further reduced to hydrazo compounds with zinc and sodium hydroxide, with hydrazine hydrate and Raney nickel,[1752] or with $LiAlH_4$ mixed with a metal chloride such as $TiCl_4$ or VCl_3.[1753] The reduction has also been accomplished electrochemically.

OS **III**, 103.

F. Reactions in Which an Organic Substrate is Both Oxidized and Reduced

Some reactions that belong in this category have been considered in earlier chapters. Among these are the Tollens' condensation (**16-43**), the benzil–benzilic acid rearrangement (**18-6**), and the Wallach rearrangement (**18-43**).

19-81 The Cannizzaro Reaction

Cannizzaro Aldehyde Disproportionation

$$2\,ArCHO \xrightarrow{NaOH} ArCH_2OH + ArCOO^-$$

Aromatic aldehydes, and aliphatic ones with no a hydrogen, give the *Cannizzaro reaction* when treated with NaOH or other strong bases.[1754] In this reaction, one molecule of aldehyde oxidizes another to the acid and is itself reduced to the primary alcohol. Aldehydes with an α-hydrogen do not give the reaction, because when these compounds are treated with base the aldol reaction (**16-34**) is much faster.[1755] Normally, the best yield of acid or alcohol is 50% each, but this can

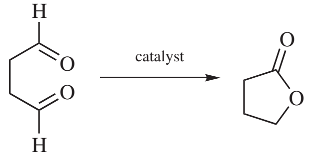
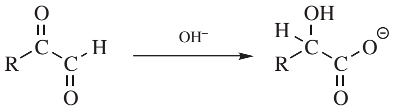
be altered in certain cases. Solvent-free reactions are known.[1756] On the other hand, high yields of alcohol can be obtained from almost any aldehyde by running the reaction in the presence of formaldehyde.[1757] In this case, the formaldehyde reduces the aldehyde to alcohol and is itself oxidized to formic acid. In such a case, where the oxidant aldehyde differs from the reductant aldehyde, the reaction is called the *crossed-Cannizzaro reaction*.[1758] The Tollens' condensation (**16-43**) includes a crossed-Cannizzaro reaction as its last step. A Cannizzaro reaction run on 1,4-dialdehydes (note that α hydrogens are present here) with a rhodium catalyst gives ring closure, for example,[1759]



The product is the lactone derived from the hydroxy acid that would result from a normal Cannizzaro reaction. Chiral additives have been used, but with bis(oxazolidine) derivatives the reaction proceeded with poor enantioselectivity.[1760]

α-Keto aldehydes give internal Cannizzaro reactions:



This product is also obtained on alkaline hydrolysis of compounds of the formula $RCOCHX_2$. Similar reactions have been performed on α-keto acetals[1761] and γ-keto aldehydes.

The mechanism[1762] of the Cannizzaro reaction[1763] involves a hydride shift (an example of mechanism type 2, p. 1706). First ^{-}OH adds to the C=O to give **55**, which may lose a proton in the basic solution to give the diion **56**.

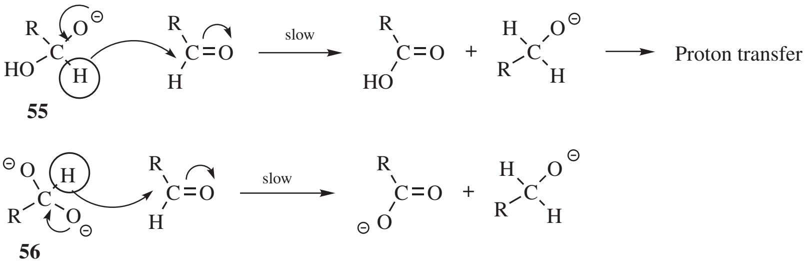
[1763]See for example, Swain, C.G.; Powell, A.L.; Sheppard, W.A.; Morgan, C.R. *J. Am. Chem. Soc.* ***1979***, *101*, 3576; Watt, C.I.F. *Adv. Phys. Org. Chem.* ***1988***, *24*, 57, 81–86.

The strong electron-donating character of O^- greatly facilitates the ability of the aldehydic hydrogen to leave with its electron pair. Of course, this effect is even stronger in **56**. Hydride is transferred to another molecule of aldehyde. The hydride can come from **55** or **56**:



If the hydride ion comes from **55**, the final step is a rapid proton transfer. In the other case, the acid salt is formed directly, and the alkoxide ion acquires a proton from the solvent. Evidence for this mechanism is (*1*) The reaction can be first order in base and second order in substrate (thus going through **55**) or, at higher base concentrations, second order in each (going through **56**); and (*2*) when the reaction was run in D_2O, the recovered alcohol contained no α deuterium,[1764] indicating that the hydrogen comes from another equivalent of aldehyde and not from the medium.[1765]

OS **I**, 276; **II**, 590; **III**, 538; **IV**, 110.

19-82 The Tishchenko Reaction

Tishchenko aldehyde-ester disproportionation

$$2\,ArCHO \xrightarrow{Al(OEt)_3} ROOCH_2R$$

When aldehydes, with or without a hydrogen, are treated with aluminum ethoxide, one molecule is oxidized and another reduced, as in **19-81**, but here they are found as the ester. The process is called the *Tishchenko reaction*. Crossed-Tishchenko reactions are also possible. With more strongly basic alkoxides, such as magnesium or sodium alkoxides, aldehydes with an a hydrogen give the aldol reaction. Treatment of a dialdehyde, such as phthalic dicarboxaldehyde (phthalaldehyde) with CaO, leads to a lactone.[1766] Like **19-81**, this reaction has a mechanism that

[1764]Fredenhagen, H.; Bonhoeffer, K.F. *Z. Phys. Chem. Abt. A* ***1938***, *181*, 379; Hauser, C.R.; Hamrick, Jr., P.J.; Stewart, A.T. *J. Org. Chem.* ***1956***, *21*, 260.

[1765]When the reaction was run at 100°C, in MeOH–H_2O, isotopic exchange was observed (the product from PhCDO had lost some of its deuterium): Swain, C.G.; Powell, A.L.; Lynch, T.J.; Alpha, S.R.; Dunlap, R.P. *J. Am. Chem. Soc.* ***1979***, *101*, 3584. Side reactions were postulated to account for the loss of deuterium. See, however, Chung, S. *J. Chem. Soc. Chem. Commun.* ***1982***, 480.

[1766]Seki, T.; Hattori, H. *Chem. Commun.* ***2001***, 2510.

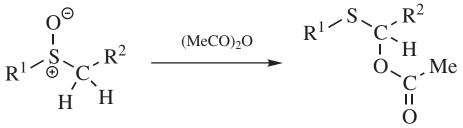
involves hydride transfer.[1767] The Tishchenko reaction can also be catalyzed[1768] by ruthenium complexes,[1769] by Cp_2ZrH_2[1770] or BuTi(*Oi*Pr)$_4$Li,[1771] and, for aromatic aldehydes, by disodium tetracarbonylferrate, $Na_2Fe(CO)_4$.[1772] Both CaO (noted above) and SrO have been used as catalysts.[1773] A bisphenylenedioxy bis-(aluminum) catalyst has been used to convert aliphatic aldehydes to the corresponding ester.[1774] The bis Al(*Oi*Pr)$_2$ derivative of catechol has also been used as a catalyst.[1775]

A Tishchenko–aldol-transfer reaction was reported using β-hydroxy ketones and an aldehydes with an $AlMe_3$ catalyst, giving a mono acyl diol.[1776]

OS **I**, 104.

19-83 The Pummerer Rearrangement[1777]

Pummerer methyl sulfoxide rearrangement



When sulfoxides bearing an a hydrogen are treated with acetic anhydride, the product is an α-acetoxy sulfide. This is one example of *the Pummerer rearrangement*, in which the sulfur is reduced while an adjacent carbon is oxidized.[1778] The product is readily hydrolyzed (**10-6**) to the aldehyde R_2CHO.[1779] Besides acetic anhydride, other anhydrides and acyl halides give similar products. Inorganic acids, such as HCl, also give the reaction, and $RSOCH_2R'$ can be converted to RSCHClR′ in this way. Sulfoxides can also be converted to α-halo sulfides[1780] by other

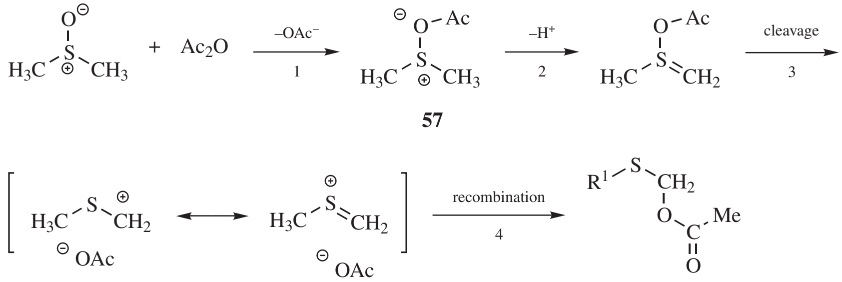
reagents, including sulfuryl chloride, NBS, and NCS. Enantioselective Pummerer rearrangements are known.[1781] Uncatalyzed thermal rearrangements are also known.[1782]

The following four-step mechanism has been proposed for the reaction between acetic anhydride and DMSO:[1783]



57

For DMSO and acetic anhydride, step 4 is intermolecular, as shown by ^{18}O isotopic labeling studies.[1784] With other substrates, however, step 4 can be inter- or intramolecular, depending on the structure of the sulfoxide.[1785] Depending on the substrate and reagent, any of the first three steps can be rate determining. In the case of Me_2SO treated with $(F_3CCO)_2O$, the intermediate corresponding to **57**[1786] could be isolated at low temperature, and on warming gave the expected product.[1787] There is much other evidence for this mechanism.[1788]

A sila-Pummerer rearrangement has been reported.[1789]

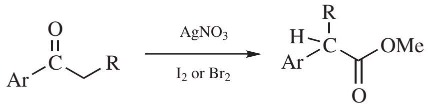
[1789]Kirpichenko, S.V.; Suslova, E.N.; Albanov, A.I.; Shainyan, B.A. *Tetrahedron Lett.* ***1999***, *40*, 185.

In the *Willgerodt reaction*, a straight- or branched-chain aryl alkyl ketone is converted to the amide and/or the ammonium salt of the acid by heating with ammonium polysulfide.[1790] The carbonyl group of the product is always at the end of the chain. Thus $ArCOCH_2CH_3$ gives the amide and the salt of $ArCH_2CH_2COOH$, and $ArCOCH_2CH_2CH_3$ gives derivatives of $ArCH_2CH_2CH_2COOH$. However, yields sharply decrease with increasing length of chain. The reaction has also been carried out on vinylic and ethynyl aromatic compounds and on aliphatic ketones, but yields are usually lower in these cases. Unlike the Pummerer rearrangement (**19-83**), which involves transposition of an oxygen from S to C, the Willgerodt reaction involves oxygen migration *and* oxidation of the organic species. The use of sulfur and a dry primary or secondary amine (or ammonia), as the reagent is called the *Kindler modification* of the Willgerodt reaction.[1791] The product in this case is $Ar(CH_2)_nCSNR_2$,[1792] which can be hydrolyzed to the acid. Particularly good results are obtained with morpholine as the amine. For volatile amines, the HCl salts can be used instead, with NaOAc in DMF at 100°C.[1793] Dimethylamine has also been used in the form of dimethylammonium dimethylcarbamate, $Me_2NCOO^- Me_2NH_2^+$.[1794] The Kindler modification has also been applied to aliphatic ketones.[1795] Thioamides have been prepared from ketones in a base-catalyzed reaction.[1796]

Alkyl aryl ketones can be converted to arylacetic acid derivatives in an entirely different manner. The reaction consists of treatment of the substrate with silver nitrate and I_2 or Br_2,[1797] or with thallium nitrate, MeOH, and trimethyl orthoformate adsorbed on Montmorillonite K10, an acidic clay.[1798]



The mechanism of the Willgerodt reaction is not completely known, but some conceivable mechanisms can be excluded. Thus, one might suppose that the alkyl group becomes completely detached from the ring, and then attacks it with its other

[1790]For a review, see Brown, E.V. *Synthesis* ***1975***, 358.

[1791]For a review, see Mayer, R., in Oae, S. *The Organic Chemistry of Sulfur*, Plenum, NY, ***1977***, pp. 58–63. [1798]Taylor, E.C.; Conley, R.A.; Katz, A.H.; McKillop, A. *J. Org. Chem.* ***1984***, *49*, 3840.

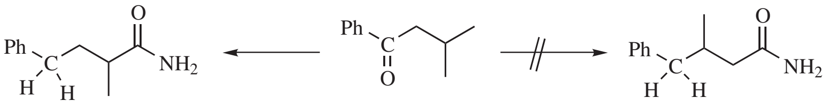
end. However, this possibility is ruled out by experiments such as the following: When isobutyl phenyl ketone (**58**) is subjected to the Willgerodt reaction, the product is **59**, not **60**, which would arise if the end carbon of the ketone became bonded to the ring in the product:[1799]



59 **58** **60**

This also excludes a cyclic-intermediate mechanism similar to that of the Claisen rearrangement (**18-33**). Another important fact is that the reaction is successful for singly branched side chains, such as **58**, but not for doubly branched side chains, as in $PhCOCMe_3$.[1799] Still another piece of evidence is that compounds oxygenated along the chain give the same products; thus $PhCOCH_2CH_3$, $PhCH_2COMe$, and $PhCH_2CH_2CHO$ all give $PhCH_2CH_2CONH_2$.[1800] All these facts point to a mechanism consisting of consecutive oxidations and reductions along the chain, although just what form these take is not certain. Initial reduction to the hydrocarbon can be ruled out, since alkylbenzenes do not give the reaction. In certain cases, imines[1801] or enamines[1802] have been isolated from primary and secondary amines, respectively, and these have been shown to give the normal products, leading to the suggestion that they may be reaction intermediates.

[1799]King, J.A.; McMillan, F.H. *J. Am. Chem. Soc.* ***1946***, *68*, 632.

APPENDIX A

The Literature of Organic Chemistry

All discoveries in the laboratory must be published somewhere if the information is to be made generally available. A new experimental result that is not published might as well not have been obtained, insofar as it benefits the entire chemical world. The total body of chemical knowledge (called *the literature*) is located on the combined shelves of all the chemical libraries in the world. Anyone who wishes to learn whether the answer to any chemical question is known, and, if so, what the answer is, has only to turn to the contents of these shelves. Indeed, the very expressions "is known," "has been done," and so on, really mean "has been published." To the uninitiated, the contents of the shelves may appear formidably large, but fortunately the process of extracting information from the literature of organic chemistry is usually not difficult. In this appendix, we will examine the literature of organic chemistry.[1] It is quite clear that The Literature can be divided into two broad categories: primary sources and secondary sources. A *primary source* publishes the original results of laboratory investigations. Books, indexes, and other publications that cover material that has previously been published in primary sources are called *secondary sources*. It is because of the excellence of the secondary sources in organic chemistry (especially *Chemical Abstracts*™, SciFinder®, and Beilstein) that literature searching is comparatively not difficult. The two chief kinds of primary source are journals and patents. There are several types of secondary source.

[1]For books on the chemical literature, see Wolman, Y. *Chemical Information*, 2nd ed., Wiley, NY, ***1988***; Maizell, R.E. *How to Find Chemical Information,* 2nd ed., Wiley, NY, ***1987***; Mellon, M.G. *Chemical Publications,* 5th ed., McGraw-Hill, NY, ***1982***; Skolnik, H. *The Literature Matrix of Chemistry*, Wiley, NY, ***1982***; Antony, A. *Guide to Basic Information Sources in Chemistry,* Jeffrey Norton Publishers, NY, ***1979***; Bottle, R.T. *Use of the Chemical Literature,* Butterworth, London, ***1979***; Woodburn, H.M. *Using the Chemical Literature,* Marcel Dekker, NY, ***1974***. For a three-part article on the literature of organic chemistry, see Hancock, J.E.H. *J. Chem. Educ.* ***1968***, *45*, 193–199, 260–266, 336–339.

PRIMARY SOURCES

Journals

For well over 100 years, nearly all new work in organic chemistry (except for that disclosed in patents) has been published in journals. There are thousands of journals that publish chemical papers, in many countries and in many languages. Some print papers covering all fields of science; some are restricted to chemistry; some to organic chemistry; and some are still more specialized. Fortunately for the sanity of organic chemists, the vast majority of important papers in "pure" organic chemistry (as opposed to "applied") are published in relatively few journals, perhaps 50 or fewer. The concept of "pure" organic chemistry is not as useful because organic chemistry is now important in many areas. Literature that is important to an organic chemist is found in journals and patents that focus on bioorganic, organometallic, materials science, separation science, medicinal chemistry, pharmaceutical sciences, and medicine to name a few. The reader is therefore cautioned that the journals listed in this section have organic chemistry as their primary focus, but are by no means the only sources of information concerning organic chemistry. The literature is vast and many journals are published weekly, and some semimonthly.

In addition to ordinary papers, there are two other types of publications in which original work is reported: *notes* and *communic*ation*s*. A note is a brief paper, often without a summary (nearly all papers are published with summaries or abstracts prepared by the author). Otherwise, a note is similar to a paper.[2] Communications (also called *letters*) are also brief and usually without summaries (though some journals now publish summaries along with their communications, a welcome trend). However, communications differ from notes and papers in three respects:

1. They are brief, not because the work is of small scope, but because they are condensed. Usually, they include only the most important experimental details or none at all.
2. They are often of immediate significance. Journals that publish communications make every effort to have them appear as soon as possible after they are received. Some papers and notes are of great importance, and some are of lesser importance, but all communications are supposed to be of high importance. With modern computer technology, communications can often be published in a matter of weeks, and the on-line version (e.g., the American Chemical Society ASAP papers) can be found before the print version appears.
3. Communications are preliminary reports, and the material in them may be republished as papers at a later date, in contrast to the material in papers and notes, which cannot be republished.

[2]In some journals, notes are called "short communications," an unfortunate practice, because they are not communications as that term is defined in the text.

Although papers (we use the term in its general sense, to cover notes and communications also) are published in many languages, the English-speaking chemist is in a fairly fortunate position. At present well over half of the important papers in organic chemistry are published in English. Not only are American, British, and British Commonwealth journals published almost entirely in English, but so are many others around the world. There are predominantly English-language journals published in Japan, Italy, Czechoslovakia, Sweden, The Netherlands, Israel, and other countries. In a reorganization, six prominent European journals (*Chemische Berichte, Liebigs Annalen der Chemie*, *Bulletin de la Société Chimique de France, Bulletin des Sociétés Chimique Belges, Recueil des Travaux Chimiques des Pays-Bas, and Gazzetta Chimica Italiana*) have been discontinued. In their place is the *European Journal of Organic Chemistry, published in English.* Most of the articles published in other languages have summaries printed in English also. For many years, the second most important language (in terms of the number of organic chemical papers published) was Russian, and most of these papers are available in English translation, although in most cases, 6 months to 1 year later. With the political changes in Russia, however, many of these Journals have been modified or discontinued. Important papers have been published in German and French for >200 years, and these are generally not available in translation, so that the organic chemist should have at least a reading knowledge of these languages. In recent years, however, fewer papers in French or German have appeared without an English translation, such as in the journal *Angewandte Chemie*, which in 1962 became available in English under the title *Angewandte Chemie International Edition in English*. Of course, a reading knowledge of French and German (especially German) is critical for the older literature. Before ~1920, more than one-half of the important chemical papers were in these languages. It must be realized that the original literature is never obsolete. With the rise of China in the scientific community, journals are published in Chinese, and there are journals published in Japanese. Work by Chinese and Japanese scientists regularly appears in English-language journals, however. Secondary sources become superseded or outdated, but nineteenth century journals are found in most chemical libraries and are still consulted. Table A.1 presents a list of the more important current journals that publish original papers[3] and communications in organic chemistry. Some of them also publish review articles, book reviews, and other material. Changes in journal title have not been infrequent; footnotes to the table indicate some of the more important, but some of the other journals listed have also undergone title changes. In 1999, the *Journal of Organic Chemistry* stopped publishing communications, and these are now published in a new journal, *Organic Letters*.

The primary literature has grown so much in recent years that attempts have been made to reduce the volume. One such attempt is the *Journal of Chemical Research*, begun in 1977. The main section of this journal, called the "Synopses," publishes synopses, which are essentially long abstracts, with references. The full texts of most of the papers are published only in microfiche and miniprint versions.

[3]In Table A.1, notes are counted as papers.

TABLE A.1. A List of the More Important *Current* Journals That Currently Publish Original Papers in Organic Chemistry[a]

[a]These Journals are listed in alphabetical order of *Chemical Abstracts*™ abbreviations, Which Are Indicated in Boldface. Also given are the year of founding, number of issues per year as of 1998, and whether the journal primarily publishes papers (P), communications (C), or both.

[9]Before 1978 this journal was called ***Roczniki Chemii***.
[10]*Pure Appl. Chem.* publishes IUPAC reports and lectures given at IUPAC meetings.
[11]Before 1989 this journal was called ***Rev**iews of **Chem**ical **Intermed**iates*.

For some years, the American Chemical Society journals, including *J. Am. Chem. Soc.* and *J. Org. Chem.*, have provided supplementary material for some of their papers. This material is available on-line, and for older literature from the Microforms and Back Issues Office at the ACS Washington, DC, office, either on microfiche or as a photocopy. Many other journals now offer supplementary material, generally experimental procedures, supporting spectral data and crystallographic data. These practices have not yet succeeded in substantially reducing the total volume of the world's primary chemical literature.

Patents

In many countries, including the United States, it is possible to patent a new compound or a new method for making a known compound (either laboratory or industrial procedures), as long as the compounds are useful. It comes as a surprise to many to learn that a substantial proportion of the patents granted (perhaps 20–30%) have been chemical patents. Chemical patents are part of the chemical literature, and both U.S. and foreign patents are regularly abstracted by *Chemical Abstracts*™. In addition to learning about the contents of patents from this source, chemists may consult the *Official Gazette* of the U.S. Patent Office, which, published weekly and available in many libraries, lists titles of all patents issued that week. Bound volumes of all U.S. patents are kept in a number of large libraries, including the New York Public Library, which also has an extensive collection of foreign patents. Photocopies of any U.S. patent and most foreign patents can be obtained at low cost from the U.S. Patent and Trademark Office, Washington, DC, 20231. Many patents can now be obtained on-line as well. In addition, *Chemical Abstracts*™ lists, in the introduction to the first issue of each volume, instructions for obtaining patents from 26 countries. Patents are also available via SciFinder®.

Although patents are often very useful to the laboratory chemist, and no literature search is complete that neglects relevant patents, as a rule they are not as reliable as papers. There are two reasons for this:

1. It is in the interest of the inventor to claim as much as possible. Therefore, they may, for example, actually have carried out a reaction with ethanol and with 1-propanol, but will claim all primary alcohols, and perhaps even secondary and tertiary alcohols, glycols, and phenols. An investigator repeating the reaction on an alcohol that the inventor did not use may find that the reaction gives no yield at all. In general, it is safest to duplicate the actual examples given, of which most chemical patents contain one or more.
2. Although legally a patent gives an inventor a monopoly, any alleged infringements must be protected in court, and this may cost a good deal of money. Therefore some patents are written so that certain essential details are concealed or entirely omitted. This practice is not exactly cricket, because a patent is supposed to be a full disclosure, but patent attorneys are generally

skilled in the art of writing patents, and procedures given are not always sufficient to duplicate the results.

Fortunately, the above statements do not apply to all chemical patents: many make full disclosures and claim only what was actually done. It must also be pointed out that it is not always possible to duplicate the work reported in every paper in a journal due to the use of proprietary catalysts, equipment, or procedures. Note, however, that some work is not published or patented, but rather maintained within the company as a trade secret. Such work is not, of course, available to the public.

SECONDARY SOURCES

Journal articles and patents contain virtually all of the original work in organic chemistry. However, if therewere no indexes, abstracts, review articles, and other secondary sources, the literature would be unusable, because it is so vast that no one could hope to find anything in particular. Fortunately, the secondary sources are excellent. There are various kinds and the categories tend to merge. Our classification is somewhat arbitrary.

Listings of Titles

The profusion of original papers is so great that publications that merely list the titles of current papers find much use. Such lists are primarily methods of alerting the chemist to useful papers published in journals that they do not normally read. This approach, using print versions containing lists or journals and articles, is not used much nowadays. Most journals are available on-line, and many have the original papers, with supplemental material, as HTML and pdf[12] documents. The pdf document can be downloaded to the searcher's desktop, usually for a fee, and is most convenient. *Chemical Abstracts*™ was originally available on-line as *CAS ONLINE*. CAS ONLINE was discontinued when STN® (a service that CAS operates in cooperation with the German organization FIZ Karlsruhe, see below) was introduced in 1984. All of the *Chemical Abstracts*™ literature can be accessed using CAS databases online. Many libraries and companies pay the appropriate fees, so accessing the journals is usually quite easy via those organizations. Search engines allow one to quickly scan an enormous amount of literature from office or home. in addition, most browsers have on-line searching capabilities via various search engines, and simply typing in an author, a topic, a chemical, or a few key words can lead to important articles or information. Some of the important on-line technology will be discussed below. However, some of the available resources[13] include Specialty Citation Indexes, Science Citation Index Expanded™, Web of Science®,

[12]Adobe Acrobat© files.
[13]See http://scientific.thomson.com/products/categories/citation/

Science Citation Index®, ISI ProceedingsSM, Reaction Citation Index™, and the Derwent Innovations IndexSM. Science Citation Index® is available on STN®, where it is called SciSearch. We will begin with the older print-versions for chemical searches.

A print-version "title" publication covering the whole of chemistry is *Current Contents Physical, Chemical & Earth Sciences*,[14] which began in 1967 and appears weekly, contains the contents pages of all issues of ~800 journals in chemistry, physics, earth sciences, mathematics, and allied sciences. Each issue contains an index of important words taken from the titles of the papers listed in that issue, and an author index, which, however, lists only the first-named author of each paper. The author's address is also given, so that one may write for reprints. An on-line service is available called Current Contents Connect® is a multidisciplinary Web resource providing access to complete bibliographic information from >8000 of the world's leading scholarly journals and >2000 books.[15]

CAS databases on-line described below allows one to search a variety of databases, including journal titles.

Abstracts

Listings of titles are valuable, as far as they go, but they do not tell what is in the paper, beyond the implications carried by the titles. Most current journals contain a graphic abstract as well as a title and a brief print description of the research. The graphical abstract is extremely useful for scanning the literature presented in a journal, and both the print and graphical abstracts are available on-line for most journals.

From the earliest days of organic chemistry, abstracts of papers have been widely available, often as sections of journals whose principal interests lay elsewhere.[16] At the present time there are only two publications entirely devoted to abstracts covering the whole field of chemistry. One of these, *Referativnyi Zhurnal, Khimiya*, which began in 1953, is published in Russian and is chiefly of interest to Russian-speaking chemists. The other is *Chemical Abstracts*™ (CA). This publication, which appears weekly, prints abstracts in English of virtually every paper containing original work in pure or applied chemistry published anywhere in the world.[17] More than 9500 currently published journals are covered, in many languages. In addition, *CA* publishes abstracts of every patent of chemical interest from 50 national and international patent offices. *Chemical Abstracts*™ lists and indexes, but does not abstract review articles and books. The abstracts currently appear in 80 sections, of which sections 21–34 are devoted to organic chemistry, under such

[14]Title pages of organic chemistry journals are also carried by *Current Contents Life Sciences*, which is a similar publication covering biochemistry and medicine.

[15]http://scientific.thomson.com/products/ccc/

[16]For example, *Chem. Ind. (London)* publishes abstracts of papers that appear in other journals. In the past, journals, such as *J. Am. Chem. Soc., J. Chem Soc.,* and *Berchti* also did so.

[17]For a guide to the use of *CA*, see Schulz, H. *From CA to CAS ONLINE*; VCH: NY, ***1988***.

headings as Alicyclic Compounds, Alkaloids, Physical Organic Chemistry, Heterocyclic Compounds (One Heteroatom), and so on. Each abstract of a paper begins with a heading that gives (*1*) the abstract number;[18] (*2*) the title of the paper; (*3*) the authors' names as fully as given in the paper; (*4*) the authors' address; (*5*) the abbreviated name of the journal (see Table A.1);[19] (*6*) the year, volume, issue, and page numbers; and (*7*) the language of the paper. In earlier years, *CA* gave the language only if it differed from the language of the journal title. Abstracts of patents begin with the abstract number, title, inventor and company (if any), patent number, patent class number, date patent issued, country of priority, patent application number, date patent applied for, and number of pages in the patent. The body of the abstract is a concise summary of the information in the paper. For many common journals the author's summary (if there is one) is used in *CA* as it appears in the original paper, with perhaps some editing and additional information. Each issue of *CA* contains an author index, a patent index, and an index of keywords taken from the titles and the texts or contexts of the abstracts. The patent index lists all patents in order of number. The same compound or method is often patented in several countries. *Chemical Abstracts* will abstract only the first patent, but it does list the patent numbers of the duplicated patents in the patent index along with all previous patent numbers that correspond to it. Before 1981, there were separate Patent Number Indexes and Patent Concordances (the latter began in 1963).

At the end of each section of *CA*, there is a list of cross-references to related papers in other sections.

Chemical Abstracts™ is, of course, highly used for "current awareness"; it allows one to read, in one place, abstracts of virtually all new work in chemistry, though its large size puts a limit on the extent of this type of usefulness.[20] *Chemical Abstracts*™ is even more useful as a repository of chemical information, a place for finding out what was done in the past. This value stems from the excellent indexes, which enable the chemist in most cases to ascertain quickly where information is located. From the time of its founding in 1907 until 1961, *CA* published annual indexes. Since 1962 there are two volumes published each year, and a separate index is issued for each volume. For each volume there is an index of subjects, authors, formulas, and patent numbers. Beginning in 1972, the subject index has been issued in two parts, a chemical substance index and a general subject index, which includes all entries that are not the names of single chemical substances. However, the indexes to each volume become essentially superseded as collective indexes are issued. The first collective indexes are 10-year (decennial) indexes, but the volume of information has made 5-year indexes necessary since 1956. Collective indexes published to date are shown in Table A.2. Thus a user of the indexes at the time of this writing would consult the collective indexes through 1995 and the semiannual indexes thereafter. The 14th collective index (covering

[18]Beginning in 1967. See p. 1880.

[19]These abbreviations are changed from time to time. Therefore the reader may notice inconsistencies.

[20]It is possible to subscribe to *CA Selects,* which provides copies of all abstracts within various narrow fields, such as organofluorine chemistry, organic reaction mechanisms, and organic stereochemistry.

TABLE A.2. *CA* Collective Indexes Published

Collective Index	Subject and General Subject	Chemical Substance	Author	Formula	Patent
1	1907–1916		1907–1916		
2	1917–1926		1917–1926		1907–1936

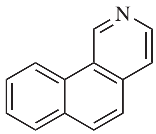
14	1997–2001	1997–2001	1997–2001	1997–2001	1997–2001
15	2002–2006	2002–2006	2002–2006	2002–2006	2002–2006

1997–2001) appeared in 2002. The 15th Collective index will be issued only in CD ROM, as well as any subsequent collective, presumably.

Beginning with the eighth collective index period, *CA* has published an *Index Guide*. This publication gives structural formulas and/or alternate names for thousands of compounds, as well as many other cross-references. It is designed to help the user efficiently and rapidly to find *CA* references to subjects of interest in the general subject, formula, and chemical substance indexes. Each collective index contains its own *Index Guide*. A new *Index Guide* is issued every 18 months. The *Index Guide* is necessary because the *CA* general subject index is a "controlled index," meaning it restricts its entries only to certain terms. For example, anyone who looks for the term "refraction" in the general subject index will not find it. The *Index Guide* includes this term, and directs the reader to "Electromagnetic wave, refraction of," "Sound and ultrasound, refraction of," and other terms, all of which will be found in the general subject index. Similarly, the chemical substance index usually lists a compound only under one name, the approved *CA* name. Trivial and other names will be found in the *Index Guide*. For example, the term "methyl carbonate" is not in the chemical substance index, but the *Index Guide* does have this term, and tells us to look for it in the chemical substance index under the headings "carbonic acid, esters, dimethyl ester" (for Me_2CO_3) and "carbonic acid, esters, monomethyl ester" (for $MeHCO_3$). Furthermore, the *Index Guide* gives terms related to the chosen term, helping users to broaden a search. For example, one who looks for "Atomic orbital" in the *Index Guide* will find the terms "Energy Level," "Molecular orbital," "Atomic integral," and "Exchange, quantum mechanical, integrals for," all of which are controlled index terms.

Along with each index (annual, semiannual, or collective) appears an index of ring systems. This valuable index enables the user to ascertain immediately if any ring system appears in the corresponding subject or chemical substance index and under what names. For example, someone wishing to determine whether any compounds containing this ring system



Benz(*h*)isoquinoline

are reported in the 1982–1986 collective index (even if they did not know the name) would locate, under the heading "3-ring systems," the listing **6**, **6**, **6** (since the compound has three rings of six members each), under which they would find the sublisting C_5N—C_6—C_6 (since one ring contains five carbons and a nitrogen while the others are all-carbon), under which is listed the name benz(*h*)isoquinoline, as well as the names of 30 other systems C_5N—C_6—C_6. A search of the chemical substance index under these names will give all references to these ring systems that appeared in *CA* from 1982 to 1986.

Before 1967, *CA* used a two-column page, with each column separately numbered. A row of letters from *a* to *h* appeared down the center of the page. These letters are for the guidance of the user. Thus an entry 7337*b* refers to the *b* section of column 7337. In early years, superscript numbers (e.g., 4327^5), were used in a similar manner. In very early years, these numbers were not printed on the page at all, though they are given in the decennial indexes, so that the user must mentally divide the page into nine parts. Beginning with 1967, abstracts are individually numbered and column numbers are discarded. Therefore, beginning with 1967, index entries give abstract number rather than column number. The abstract numbers are followed by a letter that serves as a check character to prevent miscopying errors in computer handling. To use the *CA* general subject, chemical substance, and formula indexes intelligently requires practice, and the student should become familiar with representative volumes of these indexes and with the introductory sections to them, as well as with the *Index Guides*.

In the *CA* formula indexes, formulas are listed in order of (*1*) number of carbon atoms; (*2*) number of hydrogen atoms; (*3*) other elements in alphabetic order. Thus, all C_3 compounds are listed before any C_4 compound; all C_5H_7 compounds before any C_5H_8 compound; $C_7H_{11}Br$ before $C_7H_{11}N$; $C_9H_6N_4S$ before C_9H_6O, and so on. Deuterium and tritium are represented by D and T and treated alphabetically, for example, C_2H_5DO after C_2H_5Cl and before C_2H_5F or C_2H_6.

Since 1965, *CA* has assigned a Registry Number to each unique chemical substance; CAS Registry Number®. This is a number of the form [*766-51-8*] that remains invariant, no matter what names are used in the literature. More than

10 million numbers have already been assigned and thousands are added each week. At one time, all numbers published with the *CA* preferred names appeared in a multivolume "Registry Handbook," but this work was discontinued. The CAS Registry contains >27 million organic and inorganic substances and >57 million sequences.[21] For a discussion of online searching see pp. 1901–1905.

There were a number of earlier abstracting publications now defunct. The most important are *Chemisches Zentralblatt* and *British Abstracts*. These publications are still valuable because they began before *CA* and can therefore supply abstracts for papers that appeared before 1907. Furthermore, even for papers published after 1907, *Zentralblatt* and *British Abstracts* are often more detailed. *Zentralblatt* was published, under various names, from 1830 to 1969.[22] *British Abstracts* was a separate publication from 1926 to 1953, but earlier abstracts from this source are available in the *Journal of the Chemical Society* from 1871 to 1925.

Beilstein

This publication is so important to organic chemistry that it deserves a section by itself. Beilstein's *Handbuch der Organischen Chemie*, usually referred to as *Beilstein*, lists all the known organic compounds reported in the literature during its period of coverage. We will first describe the print version, particularly important for older literature. This discussion will be followed by a description of the on-line version of Beilstein – Crossfire Beilstein. For each compound are given: all names; the molecular formula; the structural formula; all methods of preparation (briefly, e.g., "by refluxing 1-butanol with NaBr and sulfuric acid"); physical constants, such as melting point and refractive index; other physical properties; chemical properties including reactions; occurrence in nature (i.e., which species it was isolated from); biological properties, if any; derivatives with melting points; analytical data, and any other information that has been reported in the literature.[23] Equally important, for every piece of information, a reference is given to the original literature. Furthermore, the data in *Beilstein* have been critically evaluated. That is, all information is carefully researched and documented, and duplicate and erroneous results are eliminated. Some compounds are discussed in two or three lines and others require several pages. The value of such a work should be obvious.

The first three editions of *Beilstein* are obsolete. The fourth edition (*vierte Auflage*) covers the literature from its beginnings through 1909. This edition, called *das Hauptwerk*, consists of 27 volumes. The compounds are arranged in order of a

[21]This total is updated daily. See http://www.cas.org/cgi-bin/regreport.pl.

[22]An "obituary" of *Zentralblatt* by Weiske, which gives its history and statistical data about its abstracts and indexes, was published in the April 1973 issue of *Chem. Ber.* (pp. I–XVI).

[23]For a discussion of how data are processed for inclusion in *Beilstein*, see Luckenbach, R.; Ecker, R.; Sunkel, J. *Angew. Chem. Int. Ed.* ***1981***, *20*, 841.

system too elaborate to discuss fully here.[24] The compounds are divided into three divisions that are further subdivided into "systems":

Division	Volumes	System Numbers
I. Acyclic Compounds	1–4	1–499
II. Carbocyclic Compounds	5–16	450–2359
III. Heterocyclic Compounds	17–27	2360–4720

Das Hauptwerk is still the basis of *Beilstein* and has not been superseded. The later literature is covered by supplements that have been arranged to parallel *das Hauptwerk*. The same system is used, so that the compounds are treated in the same order. The first supplement (*erstes Ergänzungswerk*) covers 1910–1919; the second supplement (*zweites Ergänzungwerk*) covers 1920–1929; the third supplement (*drittes Ergänzungswerk*) covers 1930–1949; the fourth supplement (*viertes Ergänzungswerk*) covers 1950–1959, and the fifth supplement covers 1960-1979. Like *das Hauptwerk*, each supplement contains 27 volumes,[25] except that supplements 3 and 4 are combined for Vols. 17–27, so that for these volumes the combined third and fourth supplement covers the years 1930–1959. Each supplement has been divided into volumes in the same way as *das Hauptwerk*, and, for example, compounds found in Vol. 3, system number 199 of *das Hauptwerk* will also be found in Vol. 3, system number 199 of each supplement. To make cross-referencing even easier, each supplement gives, for each compound, the page numbers at which the same compound can be found in the earlier books. Thus, on page 554 of Vol. 6 of the fourth supplement, under the listing phenetole are found the symbols (H 140; E I 80; E II 142; E III 545) indicating that earlier information on phenetole is given on page 140 of Vol. 6 of *das Hauptwerk*, on page 80 of the first, page 142 of the second, and page 545 of the third supplement. Furthermore, each page of the supplements contains, at the top center, the corresponding page numbers of *das Hauptwerk*. Since the same systematic order is followed in all six series, location of a compound in any one series gives its location in the other five. If a compound is found, for example, in Vol. 5 of *das Hauptwerk*, one has but to note the page number and scan Vol. 5 of each supplement until that number appears in the top center of the page (the same number often covers several pages). Of course, many compounds are found in only one, two, three, four, or five of the series, since no work may have been published on that compound during a

[24]For descriptions of the *Beilstein* system and directions for using it, see Sunkel, J.; Hoffmann, E.; Luckenbach, R. *J. Chem. Educ.* ***1981***, *58*, 982; Luckenbach, R. *CHEMTECH* ***1979***, 612. The Beilstein Institute has also published two English-language guides to the system. One, available free, is *How to Use Beilstein*; Beilstein Institute: Frankfurt/Main, ***1979***. The other is by Weissbach, O. *A Manual for the Use of Beilstein's Handbuch der Organischen Chemie*, Springer, NY, ***1976***. An older work, which many students will find easier to follow, is by Huntress, E.H. *A Brief Introduction to the Use of Beilstein's Handbuch der Organischen Chemie,* 2nd ed., Wiley, NY, ***1938***.

[25]In some cases, to keep the system parallel and to avoid books that are too big or too small, volumes are issued in two or more parts, and, in other cases, two volumes are bound as one.

particular period covered. From *das Hauptwerk* to the fourth supplement, *Beilstein* is in German, though it is not difficult to read since most of the words are the names of compounds (a *Beilstein* German–English Dictionary, available free from the publisher, is in many libraries). For the fifth supplement (covering 1960–1979), which is in English, publication of Division III began before the earlier divisions. At the time of this writing, Vols. 17–22 (totaling 70 separate parts exclusive of index volumes) of this supplement have been published, as well as a combined index for Volumes 17–19. This index covers only the fifth supplement. The subject portion of this index, which lists compound names only, gives these names in English.

Volumes 28 and 29 of *Beilstein* are subject and formula indexes, respectively. The most recent complete edition of these volumes is part of the second supplement and covers only *das Hauptwerk* and the first two supplements (though complete indexes covering *das Hauptwerk* and the first four supplements have been announced to appear in the next few years). For Vol. 1, there is a cumulative subject and a cumulative formula index, which combine *das Hauptwerk* and the first four supplements.[26] Similar index volumes, covering all four supplements, have been issued for the other volumes, 2–27. Some of these are combined (e.g., 2–3, 12–14, and 23–25). For English-speaking chemists (and probably for many German-speaking chemists) the formula indexes are more convenient. Of course (except for the fifth supplement indexes), one must still know some German, because most formula listings contain the names of many isomers. If a compound is found only in *das Hauptwerk*, the index listing is merely the volume and page numbers (e.g., **1**, 501). Roman numbers are used to indicate the supplements, for example, **26**, 15, I 5, II 7. Thus the subject and formula indexes lead at once to locations in *das Hauptwerk* and the first four supplements. The *Beilstein* formula indexes are constructed the same way as the *CA* indexes (p. 1880).

There is also a fourth division of *Beilstein* (systems 4721–4877) that covers natural products of uncertain structure: rubbers, sugars, and so on. These are treated in Vols. 30 and 31, which do not go beyond 1935, and which are covered in the collective indexes. These volumes will not be updated. All such compounds are now included in the regular *Beilstein* volumes.

Like *CA*, *Beilstein* is available on-line, with the useful search engine *CrossFire Beilstein*. The *Beilstein* database is one of the best databases for organic chemistry, particularly synthetic organic chemistry. It contains information on ~9.4 million organic substances that have been fully characterized, as well as 9.8 million reactions. Information available includes:[27]

- Structure and reaction diagrams
- Identification information (name, formula, registry numbers, etc.)

[26]Most page number entries in the combined indexes contain a letter, for example, $CHBr_2Cl$ 67f, II 33a, III 87d, IV, 81. These letters tell where on the page to find the compound and are useful because the names given in the index are not necessarily those used in the earlier series. The letter "a" means the compound is the first on its page, "b" is the second, and so on. No letters are given for the fourth supplement.

[27]http://gethelp.library.upenn.edu/guides/tutorials/scitech/beilstein/BCWhat.html

- Isolation and purification information
- Derivatives
- Physical properties, including
- Structure and energy parameters
- State of matter and change of state information
- Transport phenomena
- Optical properties
- Spectra (UV, VIS, MS, NMR, IR, ESR, X-ray, etc.)
- Electrical and magnetic properties
- Electrochemistry
- Behavior of liquid/solid, liquid/liquid, and liquid/vapor systems
- Solution behavior
- Energy data
- Optical data
- Boundary surface phenomena
- Adsorption
- Association
- Pharmacological and ecological data

Not all compounds contain all different types of data. Some data, often those quantities that can be described by a number, word, or short phrase, are given explicitly in the record for the compound. Others simply have a literature reference. The factual data, of which there are 260 million, are only experimental data, scientifically measured.

Coverage of the Literature and Search Capabilities

Beilstein references the chemical literature published in ~175 prestigious organic chemistry journals[28] from 1771 to date. It is updated quarterly. The database may be searched using structures and/or text (property information, chemical name, molecular formula)." Figure A. 1 shows the on-line page after a structure has been drawn using the drawing tools provided with the program, used by Crossfire to begin a session. Figure A. 2 shows an on-line page that displays data obtained after a structure search. The variety of tools available for searching is much more extensive than the ones shown in Figs. A.1 and A.2. One can use the structure editor to draw a specific structure, and it is possible to draw two or more structures, label them as reactant and/or product and search for a chemical reactions or transformation. A variety of data can be accessed for a compound or a reaction, and the output includes the chemical structures, references to the primary literature, physical, and spectral properties where available.

Tables of Information

In addition to *Beilstein*, there are many other reference works in organic chemistry that are essentially compilations of data. These books are very useful and often save the research worker a great deal of time. In this section we discuss some of the more important of such works.

1. The sixth edition of *Heilbron's Dictionary of Organic Compounds*, J. Buckingham, Ed., 9 vols., Chapman and Hall, London, ***1996***, contains brief listings of >150,000 organic compounds, giving names, structural formulas, physical properties, and derivatives, with references. For many entries additional data concerning occurrence, biological activity, and toxicity hazard information are also given. The arrangement is alphabetical. The dictionary contains indexes of names, formulas, heteroatoms, and *CA* Registry Numbers. Annual supplements, with cumulative indexes, have appeared since 1983. A similar work, devoted to organometallic compounds, is the 2nd edition of the *Dictionary of Organometallic Compounds*, 6 vols. in its 5th supplement,

[29]See http://www.mdl.com/products/knowledge/crossfire_commander/.

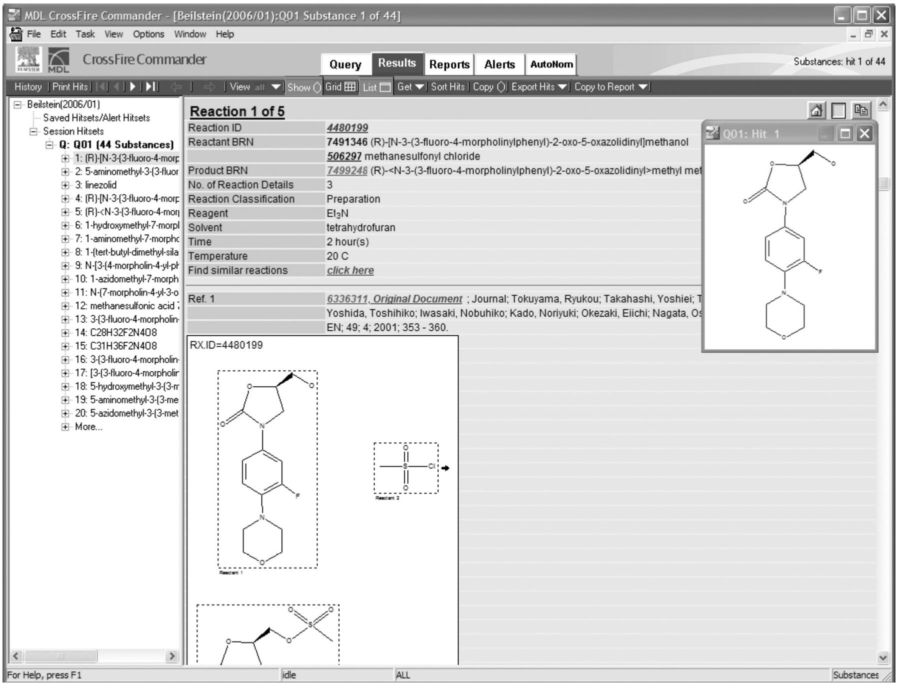

Fig. A.2. Preparation Data from CrossFire Beilstein.[30] Beilstein Data: Copyright (c) 1988–2006, Beilstein Institut zur Foerderung der Chemischen Wissenschaften licensed to Beilstein GmbH and MDL Information Systems GmbH. All rights reserved.

published by Chapman and Hall in ***1989***. Another, *Dictionary of Steroids*, 2 vols., 1991, is also published by Chapman and Hall.

2. A multivolume compendium of physical data is Landolt-Börnstein's *Zahlenwerte und Funktionen aus Physik, Chemie, Astronomie, Geophysik, und Technik*, 6th ed., Springer, Berlin, **1950**–. There is also a "New Series," for which the volumes are given the English title *Numerical Data and Functional Relationships in Science and Technology*, as well as the German title. This compendium, which is not yet complete, lists a great deal of data, some of which are of interest to organic chemists (e.g., indexes of refraction, heats of combustion, optical rotations, and spectral data). Literature references are given for all data.
3. *The Handbook of Chemistry and Physics*, CRC Press, Boca Raton, FL (called the "rubber handbook"), which is revised annually (87th ed., ***2006–2007***), is a valuable repository of data quickly found. For organic chemists the most important table is "Physical Constants of Organic Compounds,"

[30]See http://www.mdl.com/products/knowledge/crossfire_beilstein/index.jsp. Also see, http://chemistry.library.wisc.edu/beilstein/quickguide6.htm

which lists names, formulas, color, solubilities, and physical properties of thousands of compounds. However, there are many other useful tables. A similar work is *Lange's Handbook of Chemistry*, 16th ed., McGraw-Hill, New York, ***2004***. Another such handbook, but restricted to data of interest to organic chemists, is *Dean's Handbook of Organic Chemistry*, 2nd ed., McGraw-Hill, New York, ***2003***. This book also contains a long table of "Physical Constants of Organic Compounds," and has much other information including tables of thermodynamic properties, spectral peaks, pK_a values, bond distances, and dipole moments.

4. A list of most of the known natural compounds (e.g., terpenes, alkaloids, carbohydrates), to which structures have been assigned, along with structural formulas, melting points, optical rotations, and references, is provided in Devon and Scott, *Handbook of Naturally Occurring Compounds*, 3 vols., Academic Press, New York, ***1972***.
5. Dreisbach, *Physical Properties of Chemical Compounds*, Advances in Chemistry Series Nos. 15, 22, 29, American Chemical Society, Washington, DC, ***1955–1961*** lists many physical properties of >1000 organic compounds.
6. Physical properties of thousands of organometallic compounds, with references, are collected in five large compendia: the *Dictionary of Organometallic Compounds*, mentioned under item 1, above; Dub, *Organometallic Compounds*, 2nd ed., 3 vols. with supplements and index, Springer, New York, ***1966–1975***; Hagihara, Kumada, and Okawara, *Handbook of Organometallic Compounds*, W. A. Benjamin, New York, 1968; and Kaufman, *Handbook of Organometallic Compounds*, Van Nostrand, Princeton, NJ, 1961; *Comprehensive Organometallic Chemistry II,* 14 Vols, Pergamon, 1995.
7. The *Merck Index*, 13th ed., Merck and Company, Rahway, NJ, ***2001*** is a good source of information about chemicals of medicinal importance. Many drugs are given three types of name: chemical *name* (which is the name an organic chemist would give it; of course, there may well be more than one); *generic name*, which must be placed on all containers of the drug; and *trade names,* which are different for each company that markets the drug. For example, the generic name for 1-(4-chlorobenzhydryl)-4-methylpiperazine is chlorcyclazine. Among the trade names for this drug, which is an antihistamine, are Trihistan, Perazyl, and Alergicide. The *Merck Index* is especially valuable because it gives all known names of all three types for each compound and the names are cross-indexed. Also given, for each compound, are the structural formula, *CA* preferred name and Registry Number, physical properties, medicinal and other uses, toxicity indications, and references to methods of synthesis. There are indexes of formulas and Registry Numbers, and miscellaneous tables. The 10th edition of the *Merck Index* (1983) also includes a lengthy list of organic name reactions, with references. Although the 11th edition omitted this list, it was restored in the 12th and subsequent editions.

Note that the Merck Index Online™ is also available.

8. There are two publications that list properties of azeotropic mixtures. Timmermans, *The Physicochemical Constants of Binary Systems in Concentrated Solutions*, 4 vols., Interscience, New York, ***1959–1960***, is by far the more comprehensive. The other is *Azeotropic Data*, 2 vols., Advances in Chemistry Series Nos. 6 and 35, American chemical Society, Washington, DC, ***1952***, ***1962***.
9. Thousands of dipole moments, with references, are collected in McClellan, *Tables of Experimental Dipole Moments*, Vol. 1, W.H. Freeman, San Francisco, CA, ***1963***; Vol. 2, Rahara Enterprises, El Cerrita, CA, ***1974***.
10. *Tables of Interatomic Distances and Configurations in Molecules and Ions*, London chemical Society Special publication No. 11, 1958, and its supplement, Special publication No. 18, ***1965***, include bond distances and angles for hundreds of compounds, along with references.
11. The *Ring Systems Handbook*, published in ***1988*** by the Chemical Abstracts Service, provides the names and formulas of ring and cage systems that have been published in *CA*. The ring systems are listed under a system essentially the same as that used for the *CA* index of ring systems (p. $$$). Each entry gives the *CA* index name and Registry Number for that ring system. In many cases, a *CA* reference is also given. There is a separate Formula Index (for the parent ring systems) and a Ring Name Index. Cumulative supplements are issued twice a year. The *Ring Systems Handbook* supersedes earlier publications called *The Parent Compound Handbook* and *The Ring Index*.
12. The Sadtler Research Laboratories publish large collections of IR, UV, NMR and other spectra, in loose-leaf form. Indexes are available.
13. Infrared, UV, NMR, Raman, and mass spectral data, as well as melting-point, boiling-point, solubility, density, and other data for >30,000 organic compounds are collected in the *CRC Handbook of Data on Organic Compounds*, 2nd ed., 9 vols., CRC Press, Boca Raton, FL, ***1988***, edited by Weast and Grasselli. It differs from the Sadtler collection in that the data are given in tabular form (lists of peaks) rather than reproduction of the actual spectra, but this book has the advantage that all the spectral and physical data for a given compound appear at one place. References are given to the Sadtler and other collections of spectra. Volumes 7–9 contain indexes of spectral peaks for IR, UV, ^{1}H NMR, ^{13}C NMR, mass, and Raman spectra, as well as indexes of other names, molecular formulas, molecular weights, and physical constants. Annual updates began appearing in ***1990*** (the first one is called Vol. 10).
14. The *Aldrich Library of Infrared Spectra*, 3rd ed., Aldrich chemical Company, Milwaukee, WI, ***1981***, by Pouchert contains >12,000 IR spectra so arranged that the user can readily see the change that takes place in a given spectrum when a slight change is made in the structure of a molecule. The same company also publishes the *Aldrich Library of FT–IR Spectra* and the *Aldrich Library of NMR Spectra*, both also by Pouchert. A similar volume, which has IR and Raman spectra of ~1000 compounds, is *Raman/Infrared Atlas of Organic Compounds*, 2nd ed., VCH, New York, ***1989***, by Schrader.

15. An extensive list of visible and UV peaks is given in *Organic Electronic Spectral Data*, Wiley, New York. Twenty-six volumes have appeared so far, covering the literature through ***1984***.

16. A collection of 500 ^{13}C NMR spectra is found in Johnson and Jankowski, *Carbon-13 NMR Spectra*, Wiley, New York, ***1972***.

Reviews

A review article is an intensive survey of a rather narrow field; for example, the titles of some recent reviews are "Desulfonation Reactions: Recent Developments,"[31] "Pyrrolizidine and Indolizidine Syntheses Involving 1,3-Dipolar Cycloaddition,"[32] and "From Corrin Chemistry to Asymmetry Catalysis—A Personal Account."[33] A good review article is of enormous value, because it is a thorough survey of all the work done in the field under discussion. Review articles are printed in review journals and in certain books. The most important review journals in organic chemistry (though most are not exclusively devoted to organic chemistry) are shown in Table A.3. Some of the journals listed in Table A.1, for

[35]Formerly called ***Fortschr**itte der **Chem**ischen **Forsch**ung*.

example, *Synlett, Tetrahedron, Synthesis, Organic Preparations and Procedures International,* and *J. Organomet. Chem.* also publish occasional review articles.

There are several open-ended serial publications that are similar in content to the review journals, but are published irregularly (seldom more often than once a year) and are hardbound. Some of these publish reviews in all fields of chemistry; some cover only organic chemistry; some specialize further. The coverage is indicated by the titles. Table A.4 shows some of the more important such publications, with *CA* abbreviations.

There are several publications that provide listings of review articles in organic chemistry. The most important is the *J. Org. Chem.*, which began to list review articles in 1978 (the first list is at *J. Org. Chem.*, *43*, 3085), suspended the listings in 1985, and resumed them in 1990 (at *J. Org. Chem.*, *55*, 398). These lists, which appear about four times a year, give the titles and reference sources of virtually

all review articles in the field of organic chemistry that have appeared in the preceding 3 months, including those in the review journals and serials mentioned above, as well as those in monographs and treatises. There is also a listing of new monographs on a single subject. Each list includes a subject index.

Another publication is the *Index of Reviews in Organic Chemistry*, complied by Lewis, Chemical Society, London, a classified listing of review articles. The first volume, published in 1971, lists reviews from ~1960 (in some cases much earlier) to ≈ 1970 in alphabetical order of topic. Thus four reviews are listed under "Knoevenagel condensation," five under "Inclusion compounds," and one under "Vinyl ketones." There is no index. A second volume (1977) covers the literature to 1976. Annual or biannual supplements appeared from 1979 until the publication was terminated in 1985. Classified lists of review articles on organometallic chemistry are found in articles by Smith and Walton[36] and by Bruce.[37] A similar list for heterocyclic chemistry is found in articles by Katritzky and others.[38] See also the discussion of the *Index of Scientific Reviews*, p. 1908.

Annual Reviews

The review articles discussed in the previous section are each devoted to a narrow topic covering the work done in that area over a period of years. An annual review is a publication that covers a broad area, but limits the period covered, usually to 1 or 2 years.

1. The oldest annual review publication still publishing is *Annual Reports on the Progress of Chemistry*, published by the Royal Society of Chemistry (formerly the chemical Society), which began in 1905 and which covers the whole field of chemistry. Since 1967 it has been divided into sections. Organic chemistry is found in Section B.
2. Because the number of papers in chemistry has become so large, the Royal Society of Chemistry publishes annual-review-type volumes of smaller scope, called *Specialist Periodical Reports*. Among those of interest to organic chemists are "Carbohydrate Chemistry" (Vol. 22 covers 1988); "Photochemistry" (Vol. 21 covers 1988–1989); and "General and Synthetic Methods," (Vol. 12 covers 1987).
3. *Organic Reaction Mechanisms*, published by Wiley, New York, is an annual survey that covers the latest developments in the field of mechanisms. The first volume, covering 1965, appeared in 1966.
4. There are two annual reviews devoted to progress in organic synthesis. Theilheimer, *Synthetic Methods of Organic Chemistry*, S. Karger Verlag,

[36]Smith, J.D.; Walton, D.R.M. *Adv. Organomet. Chem.* ***1975***, *13,* 453.
[37]Bruce, M.IK. *Adv. Organomet. Chem.* ***1972***, *10,* 273, ***1973***, *11,* 447, ***1974***, *12,* 380.
[38]Belen'kii, L.I. *Adv. Heterocyclic Chem.* ***1988***, *44,* 269; Katritzky, A.R.; Jones, P.M. *Adv. Heterocyclic Chem.* ***1979***, *25,* 303; Katritzky, A.R.; Weeds, S.M. *Adv. Heterocyclic Chem.* ***1966***, *7,* 225.

Basel, is an annual compilation, beginning in 1946, of new methods for the synthesis of organic compounds, arranged according to a system based on bond closing and bond breaking reactions. Equations, brief procedures, yields, and literature references are given. Volume 44 was issued in 1990. Volumes 3 and 4 are available only in German, but all the rest are in English. There is an index to each volume. Cumulative indexes appear in every fifth volume. Beginning with Vol. 8, each volume includes a short summary of trends in synthetic organic chemistry. A more recent series is *Annual Reports in Organic Synthesis*, Academic Press, New York, which has covered the literature of each year since 1970. Equations are listed with yields and references according to a fairly simple system.

5. The *Journal Of Organometallic Chemistry* several times a year publishes annual surveys arranged according to metallic element. For example, Vol. 404, published in February 1991, contains annual surveys for 1989 of organic compounds containing Sb, Bi, and Fe, and the use of transition metals in organic synthesis, and surveys for 1988 covering B, Ru, and Os.

Awareness Services

Besides the annual reviews and the title and abstract services previously mentioned, there exist a number of publications designed to keep readers aware of new developments in organic chemistry or in specific areas of it.

1. *Chemtracts: Organic Chemistry* is a bimonthly periodical, begun in 1988, that prints abstracts of certain recently published papers (those that the editors consider most important), with commentaries on these papers by distinguished organic chemists. Important current research in bioorganic, organometallic, synthesis, physical-organic and theoretical chemistry, and pharmaceutical–medicinal chemistry is covered in each issue, giving readers updates on the newest trends and developments in organic chemistry by summarizing and commenting on current and past research..
2. The Institute for Scientific Information (ISI), besides publishing *Current Contents* (p. 1877) and the *Science Citation Index* (p. 1877), also publishes *Index Chemicus* (formerly called *Current Abstracts of Chemistry and Index Chemicus*). This publication, begun in 1960 and appearing weekly, is devoted to printing structural formulas of all new compounds appearing in >100 journals, along with equations to show how they were synthesized and an author's summary of the work. Each issue contains five indexes: author, journal, biological activity, labeled compounds, and intermediates that were not isolated. These indexes are cumulated annually.
3. Theilheimer and the *Annual Reports on Organic Synthesis*, mentioned in the previous section, list new synthetic methods once a year. There are several publications that do this monthly. Among these are *Current Chemical Reactions* (begun in 1979 and published by ISI), *Journal of Synthetic*

Methods (begun in 1975 and published by Derwent publications), and *Methods in Organic Synthesis*, begun in 1984 and published by the Royal Society of Chemistry. *Methods in Organic Synthesis* also lists books and review articles pertaining to organic synthesis.

4. *Natural Product Updates*, a monthly publication begun in 1987 and published by the Royal Society of Chemistry, lists recent results in the chemistry of natural products, along with structural formulas. It covers new compounds, struc ture determinations, new properties and total syntheses, among other topics.

General Treatises

There are a number of large-scale multivolume treatises that cover the whole field of organic chemistry or large areas of it.

1. *Rodd's Chemistry of Carbon Compounds*, edited by Coffey, Elsevier, Amsterdam, The Netherlands, is a treatise consisting of five main volumes, each of which contains several parts. publication began in 1964 and is not yet complete. The organization is not greatly different from most textbooks, but the coverage is much broader and deeper. Supplements to many of the volumes have appeared. An earlier edition, called *Chemistry of Carbon Compounds*, edited by Rodd, was published in 10 parts from 1951 to 1962.
2. Houben–Weyl's, *Methoden der Organischen Chemie*, Georg Thieme Verlag, Stuttgart, is a major treatise in German devoted to laboratory methods. The fourth edition, which was begun in 1952 and consists of 20 volumes, most of them in several parts, is edited by E. Muller. The series includes supplementary volumes. The first four volumes contain general laboratory methods, analytical methods, physical methods, and general chemical methods. The later volumes are devoted to the synthesis of specific types of compounds, for example, hydrocarbons, oxygen compounds, and nitrogen compounds. Beginning in 1990 parts of the series have appeared in English.
3. *Comprehensive Organic Chemistry*, Pergamon, Elmsford, NY, ***1979***, is a six-volume treatise on the synthesis and reactions of organic compounds. The first three volumes cover the various functional groups, Vol. 4, heterocyclic compounds, and Vol. 5, biological compounds, such as proteins, carbohydrates, and lipids. Probably the most useful volume is Vol. 6, which contains formula, subject, and author indexes, as well as indexes of reactions and reagents. The last two of these not only refer to pages within the treatise, but directly give references to review articles and original papers. For example, on p. 1129, under "Chromic acid-sulphuric acid (Jones reagent), oxidation, alcohols," are listed 13 references to original papers. Several similar treatises, including the nine-volume *Comprehensive Organometallic Chemistry* (1982), the eight volume *Comprehensive Heterocyclic Chemistry* (1984), and the six volume *Comprehensive Medicinal Chemistry* (1989) are also published by Pergamon. The indexes to these works also include references.

4. A major treatise devoted to experimental methods of chemistry is *Techniques of Chemistry*, edited first by Weissberger and then by Saunders, Wiley, New York. This publication, which began in 1970, so far consists of 21 volumes, most of them in several parts, covering such topics as electrochemical and spectral methods, kinetic methods, photochromism, and organic solvents. *Techniques of Chemistry* is a successor to an earlier series, called *Techniques of Organic Chemistry*, which appeared in 14 volumes, some of them in more than one edition, from 1945 to 1969.
5. *Comprehensive Chemical Kinetics*, edited by Bamford and Tipper, 1969–, Elsevier, Amsterdam, The Netherlands, is a multivolume treatise covering the area of reaction kinetics. Six of these volumes (not all published at the time of writing) deal with the kinetics and mechanisms of organic reactions in a thorough and comprehensive manner.
6. Three multivolume treatises that cover specific areas are Elderfield, *Heterocyclic Compounds*, Wiley, New York, 1950-; Manske and Holmes, *The Alkaloids*, Academic Press, New York, 1950-; and Simonson, Owen, Barton, and Ross, *The Terpenes*, Cambridge University Press, London, 1947–1957.
7. *Encyclopedia of Reagents for Organic Synthesis*, edited by Paquette, Wiley, New York, was published in 1995. It is an eight volume, alphabetic listing of reagents used in organic chemistry with descriptions of the preparation, use and chemistry, with references. Each reagent was researched by organic chemists active in research, who contributed to the total publication.

   This work is available on-line as **eEROS.** The *Encyclopedia of Reagents for Organic Synthesis*, e-EROS, provides updated information on ~3800 reagents with a database of close to 50,000 reactions. Each reagent entry includes properties such as physical data, solubility, form supplied in, purification, and preparative methods; examples of use in reactions; and literature references. Search options include: name, CAS number, structure and reaction.
8. *Comprehensive Organic Synthesis*, edited by Trost and Fleming, Pergamon, was published in 1991. It is a nine volume compilation.
9. *Comprehensive Organic Functional Group Transformations*, edited by Katritzky, Meth-Cohn, and Rees, Pergamon, was published in 1995. It is a seven volume compilation.

Monographs and Treatises on Specific Areas

Organic chemistry is blessed with a large number of books devoted to a thorough coverage of a specific area. Many of these are essentially very long review articles, differing from ordinary review articles only in size and scope. Some of the books are by a single author, and others have chapters by different authors but all are carefully planned to cover a specific area. Many of these books have been referred to in footnotes in appropriate places in this book. There have been several series of monographs, one of which is worth special mention: *The Chemistry of Functional Groups*, under the general editorship of Patai, published by

Wiley, New York. Each volume deals with the preparation, reactions, and physical and chemical properties of compounds containing a given functional group. Volumes covering >20 functional groups have appeared so far, including books on alkenes, cyano compounds, amines, carboxylic acids and esters, and quinones.

Textbooks

There are many excellent textbooks in the field of organic chemistry. We restrict ourselves to listing only a few of those published, mostly since 1985. Some of these are first-year texts and some are advanced (advanced texts generally give references; first-year texts do not, though they may give general bibliographies, suggestions for further reading, etc.); some cover the whole field, and others cover reactions, structure, and/or mechanism only. All the books listed here are not only good textbooks and the advanced books are valuable reference books for graduate students and practicing chemists.

Bruckner, *Advanced Organic Chemistry: Reaction Mechanisms*, Academic Press, NY ***2001***.

Bruice, *Organic Chemistry*, 4th ed., Prentice-Hall, NJ, ***2004***.

Carey, *Organic Chemistry*, 6th ed., McGraw-Hill, NY, ***2006***.

Carey and Sundberg, *Advanced Organic Chemistry: Structure and Mechanisms (Part A)*, 4th ed., Springer, ***2004.***

Carey and Sundberg, *Advanced Organic Chemistry: Structure and Mechanisms (Part B)*, 4th ed., Springer, ***2001.***

Streitwieser, Heathcock, and Kosower, *Introductory Organic Chemistry*, 4th ed., Prentice-Hall, Saddle River, NJ, ***1998***.

Sykes, *A Guidebook to Mechanism in Organic Chemistry*, 6th ed., Longmans Scientific and Technical, Essex, ***1986***.

Vollhardt and Schore, *Organic Chemistry*, 4th ed., W.H. Freeman, New York, ***2002***.

Wade, *Organic Chemistry*, 4th ed., Prentice-Hall, Upper Saddle River, NJ, ***1999***.

Other Books

In this section, we mention several books that do not fit conveniently into the previous categories. All but the last have to do with laboratory synthesis.

1. *Organic Syntheses*, published by Wiley, New York is a collection of procedures for the preparation of specific compounds. The thin annual volumes have appeared each year since 1921. For the first 59 volumes, the procedures for each 10- (or 9-) year period are collected in cumulative volumes. Beginning with Vol. 60, the cumulative volumes cover five-year periods. The cumulative volumes published so far are

Annual Volumes	Collective Volumes
1–9	**I**
10–19	**II**
20–29	**III**
30–39	**IV**
40–49	**V**
50–59	**VI**
60–64	**VII**
65–69	**VIII**
70–74	**IX**
75–80	**X**

The advantage of the procedures in *Organic Syntheses*, compared with those found in original journals, is that these procedures are *tested*. Each preparation is

carried out first by its author, and then by a member of the *Organic Syntheses* editorial board, and only if the yield is essentially duplicated is the procedure published. While it is possible to repeat most procedures given in journals, this is not always the case. All *Organic Syntheses* preparations are noted in *Beilstein* and in *CA*. In order to locate a given reaction in *Organic Syntheses*, the reader may use the OS references given in the present volume (through OS **69**); the indexes in *Organic Syntheses* itself; Shriner and Shriner, *Organic Syntheses* Collective Volumes I, II, III, IV, V *Cumulative Indices*, Wiley, New York, 1976, or Sugasawa and Nakai; Reaction Index of *Organic Syntheses*, Wiley, New York, 1967 (through OS **45**). Another book classifies virtually all the reactions in *Organic Syntheses* (collective vols. I–VII and annual vols. 65–68) into 11 categories: annulation, rearrangement, oxidation, reduction, addition, elimination, substitution, C—C bond formation, cleavage, protection–deprotection, and miscellaneous. This is *Organic Syntheses*: *Reaction Guide*, by Liotta and Volmer, published by Wiley, New York, in 1991. Some of the categories are subdivided further, and some reactions are listed in more than one category. What is given under each entry are the equation and the volume and page reference to *Organic Syntheses*.

2. Volume 1 of *Reagents for Organic Synthesis*, by Fieser and Fieser, Wiley, New York, 1967, is a 1457–page volume that discusses, in separate sections, some 1120 reagents and catalysts. It tells how each reagent is used in organic synthesis (with references) and, for each, tells which companies sell it, or how to prepare it, or both. The listing is alphabetical. Eighteen additional volumes have so far been published, which continue the format of Vol. 1 and add more recent material. A cumulative index for Vols. 1–12, by Smith and Fieser, was published in 1990. A complete cumulative index for Vol. 1–22 was published in 2005, by M.B. Smith. The series included Vol. 1–18 with Mary Fieser. After the death of Mary Fieser, the series was resumed by T. -L. Ho, and now includes Vol. 19–22.

3. *Comprehensive Organic Transformations*, 2nd ed. by Larock, Wiley-VCH, New York, ***1999***, has been frequently referred to in footnotes in Part 2 of this book. This compendium is devoted to listings of methods for the conversion of one functional group into another, and covers the literature through 1987. It is divided into nine sections covering the preparation of alkanes and arenes, alkenes, alkynes, halides, amines, ethers, alcohols and phenols, aldehydes and ketones, and nitriles, carboxylic acids and derivatives. Within each section are given many methods for synthesizing the given type of compound, arranged in a logical system. A schematic equation is given for each method, and then a list of references (without author names, to save space) for locating examples of the use of that method. When different reagents are used for the same functional group transformation, the particular reagent is shown for each reference. There is a 164-page index of group transformations. The 2nd edition has only recently been published and is *not* referenced in this edition, and a CD ROM version is now available.

4. *Survey of Organic Synthesis*, by Buehler and Pearson, Wiley, New York, 2 vols., ***1970***, ***1977***, discusses hundreds of reactions used to prepare the principal types of organic compounds. The arrangement is by chapters, each covering a functional group, (e.g., ketones, acyl halides, amines). Each reaction is thoroughly discussed and brief synthetic procedures are given. There are many references.
5. A similar publication is Sandler and Karo, *Organic Functional Group Preparations*, 2nd ed., 3 vols., Academic Press, New York, ***1983–1989***. This publication covers more functional groups than Buehler and Pearson.
6. *Compendium of Organic Synthetic Methods*, Wiley, New York, contains equations describing the preparation of thousands of monofunctional and difunctional compounds with references. Eleven volumes have been published so far (vol. 1–2, edited by Harrison and Harrison; Vol. 3, edited by Hegedus and Wade; Vol. 4–5, edited by Wade; Vol. 6–11 edited by Smith). Volume 12 will appear in 2007.
7. *The Vocabulary of Organic Chemistry*, by Orchin, Kaplan, Macomber, Wilson, and Zimmer, Wiley, New York, ***1980***, presents definitions of >1000 terms used in many branches of organic chemistry, including stereochemistry, thermodynamics, wave mechanics, natural products, and fossil fuels. There are also lists of classes of organic compounds, types of mechanism, and name reactions (with mechanisms). The arrangement is topical rather than alphabetical, but there is a good index. *Compendium of Chemical Terminology*, by Gold, Loening, McNaught, and Sehmi (the "Gold book"), published by Blackwell Scientific publications, Oxford, in 1987, is an official IUPAC list of definitions of terms in several areas of chemistry, including organic.

LITERATURE SEARCHING

Until recently searching the chemical literature meant looking only at printed materials (some of which might be on microfilm or microfiche). Now, however, much of the literature can be searched online, including some of the most important. Whether the search is online or uses only the printed material, there are two basic types of search, (*1*) searches for information about one or more specific compounds or classes of compounds, and (*2*) other types of searches. First, we will discuss searches using only printed materials, and then on-line searching.[39]

Literature Searching Using Printed Materials

Searching for Specific Compounds. Organic chemists often need to know if a compound has ever been prepared and if so, how, and/or they may be seeking a melting point, an ir spectrum, or some other property. Someone who wants all

[39]For a monograph that covers both online searching and searching using printed materials, see Wiggins, G. *Chemical Information Sources*, McGraw-Hill: NY, ***1991***.

the information that has ever been published on any compound begins by consulting the formula indexes in *Beilstein* (p. 1883). At this time there are two ways to do this. (*1*) The formula index to the second supplement (Vol. 29, see p. $$$) will quickly show whether the compound is mentioned in the literature through 1929. If it is there, the searcher turns to the pages indicated, where all methods used to prepare the compound are given, as well as all physical properties, with references. Use of the page heading method described on p. 1882 will then show the locations, if any, in the third and later supplements. (*2*) If one has an idea which volume of *Beilstein* the compound is in (and the tables of contents at the front of the volumes may help), one may search the cumulative index for that volume. If not sure, one may consult several indexes. One of these two procedures will locate all compounds mentioned in the literature through 1959. If the compound is heterocyclic, it may be in the fifth supplement. If it is in Vols. 17–19 (or in a later volume whose index has been published), the corresponding indexes may be consulted. If not, the page heading method will find it, if it was reported before 1960.[40] There is a way by which all of the above can be avoided. A computer program, called SANDRA (available from the *Beilstein* publisher), allows the user to find the *Beilstein* location by using a mouse to draw the structural formula of the compound sought. At this point, the investigator will know (*1*) all information published through 1959 or 1979,[34] or (*2*) that the compound is not mentioned in the literature through 1959 or 1979.[41] In some cases, scrutiny of *Beilstein* will be sufficient, perhaps if only a boiling point or a refractive index is required. In other cases, especially where specific laboratory directions are needed, the investigator will have to turn to the original papers.

To carry the search past 1959 (or 1979), the chemist next turns to the collective formula indexes of *Chemical Abstracts*™*:* 1957–1961; 1962–1966; 1967–1971; 1972–1976; 1977–1981; 1982–1986; 1987–1991; 1992–1996; 1997–2002, and such later collective indexes as have appeared; and the semiannual indexes thereafter. If a given formula index contains only a few references to the compound in question, the pages or abstract numbers will be given directly in the formula index. However, if there are many references, the reader will be directed to see the chemical substance index or (before 1972) the subject index for the same period; and here the number of page or abstract numbers may be very large indeed. Fortunately, numerous subheadings are given, and these often help the user to narrow the search to the more promising entries. Nevertheless, one will undoubtedly turn to many abstracts that do not prove to be helpful. In many cases, the information in the abstracts will be sufficient. If not, the original references must be consulted. In some cases (the index entry is marked by an asterisk or a double asterisk), the

[40]Compounds newly reported in the fifth supplement that are in a volume whose index has not yet been published will not be found by this procedure. To find them in *Beilstein* it is necessary to know something about the system (see Ref. 25), but they may also be found by consulting *CA* indexes beginning with the sixth collective index, or by using *Beilstein* on-line.

[41]For those heterocyclic compounds that would naturally belong to a volume for which the fifth supplement has been published.

compound is not mentioned in the abstract, though it is in the original paper or patent. Incidentally, all entries in the *CA* indexes that refer to patents are prefixed by the letter P. Since 1967, the prefixes B and R have also been used, to signify books and reviews, respectively.

By the procedure outlined above, all information regarding a specific compound that has been published up to about 1 year before the search can be found by a procedure that is always straightforward and that in many cases is rapid (if the compound has been reported only a few times). Equally important, if the compound has not been reported, the investigator will know that, too. It should be pointed out that for common compounds, such as benzene, ether, acetone, trivial mentions in the literature are not indexed (so they will not be found by this procedure), only significant ones. Thus, if acetone is converted to another compound, an index entry will be found, but not if it is used as a solvent or an eluant in a common procedure.

The best way to learn if a compound is mentioned in the literature after the period covered by the latest semiannual formula index of *CA* is to use the online services. However, if one lacks access to these, one may consult the keyword index at the end of each issue of *CA*. In these cases, of course, it is necessary to know what name might be used for the compound. The name is not necessary for *Index Chemicus*; one consults the formula indexes. However, these methods are far from complete. *Index Chemicus* lists primarily new compounds, those that would not have been found in the earlier search. The keyword indexes in *CA* are more complete, being based on internal subject matter, as well as title, but they are by no means exhaustive. Furthermore, all three of these publications lag some distance behind the original journals. To locate all references to a compound after the period covered by the latest semiannual formula index of *CA*, it is necessary to use *CAS* on-line.

The complete procedure described above may not be necessary in all cases. Often all the information one needs about a compound will be found in one of the handbooks (p. 1887), in the *Dictionary of Organic Compounds* (p. 1885), or in one of the other compendia listed in this chapter, most of which give references to the original literature.

Other Searches.[42] There is no definite procedure for making other literature searches using only printed materials. Any chemist who wishes to learn all that is known about the mechanism of the reaction between aldehydes and HCN, or which compounds of the general formula Ar_3CR have been prepared, or which are the best catalysts for Friedel–Crafts acylation of naphthalene derivatives with anhydrides, or where the group $-C(NH_2){=}N-$ absorbs in the IR, is dependent on their ingenuity and knowledge of the literature. If a specific piece of information is needed, it may be possible to find it in one of the compendia mentioned previously. If the topic is more general, the best procedure is often to begin by consulting one or more monographs, treatises, or textbooks that will give general

[42]This discussion is necessarily short. For much more extensive discussions, consult the books in Refs. 1 and 17.

background information and often provide references to review articles and original papers. In many cases, this is sufficient, but when a complete search is required, it is necessary to consult the *CA* subject and/or chemical substance indexes, where the ingenuity of the investigator is most required, for now it must be decided which words to look under. If one is interested in the mechanism of the reaction between aldehydes and HCN, one might look under "aldehydes," or "hydrogen cyanide," or even under "acetaldehyde" or "benzaldehyde," and so on, but then the search is likely to prove long. A better choice in this case would be "cyanohydrin," since these are the normal products and references there would be fewer. It would be a waste of time to look under "mechanism." In any case, many of the abstracts would not prove helpful. Literature searching of this kind is necessarily a wasteful process. Of course, the searcher would not consult the *CA* annual indexes, but only the collective indexes as far as they go and the semiannual indexes thereafter. If it is necessary to search before 1907 (and even before 1920, since *CA* was not very complete from 1907 to ~1920), recourse may be made to *Chemisches Zentralblatt* and the abstracts in the *Journal of the Chemical Society*.

Literature Searching Online[39]

Most of the *Chemical Abstracts*™ literature can be accessed using CAS databases on-line. The CAS registry[43] is the largest and most current database of chemical substance information in the world containing >26 million organic and inorganic substances and 56 million sequences. CAS is a team of scientists who provide digital information environment for scientific research and discovery and provides pathways to published research in the world's journal and patent literature back to the beginning of the twentieth century. Since 1907, CAS has indexed and summarized chemistry-related articles from >40,000 scientific journals, in addition to patents, conference proceedings and other documents pertinent to chemistry, life sciences and many other fields. In total, abstracts for >24 million documents are accessible online through CAS. Through the printed CA, CA on CD, STN, the CAS files distributed through licensed vendors, the SciFinder® and SciFinder Scholar™ desktop research tools, and the STN® Easy or STN® on the Web services, data produced by CAS is accessible to virtually any scientific researcher worldwide in industry, governmental research institutions, and academia.

Substance identification is a special strength of CAS. It is widely known as the CAS Registry, the largest substance identification system in existence. When a chemical substance, newly encountered in the literature, is processed by CAS, its molecular structure diagram, systematic chemical name, molecular formula, and other identifying information are added to the Registry and it is assigned a unique CAS Registry Number®. Registry now contains records for >26 million organic and inorganic substances and >56 million sequences.

The CAS REGISTRY contains >27 million organic and inorganic substances and >57 million sequences. A current count of substance records like this is

[43]http://www.cas.org/about.html

updated daily on the CAS web site.[44] An important piece of information that assists in such a search is the CAS Registry Number®. Each substance in REGISTRY is identified by a unique numeric identifier called a CAS Registry Number®.[45] "The CAS Registry Number® is a unique number assigned to a chemical by the Chemical Abstracts Service.[46] A fairly large collection of CAS numbers, with links to safety data for many chemicals, can be found at the listing of chemicals by CAS number at the Safety Home Page of the Physical and Theoretical Chemistry Laboratory at Oxford University."[47] The CAS Registry Number® is a unique numeric identifier that designates only one substance, has no chemical significance, and is a link to finding information about a specific chemical substance. A CAS Registry Number® includes up to nine digits that are separated into three groups by hyphens. The first part of the number, starting from the left, has up to six digits; the second part has two digits. The final part consists of a single check digit.[48]

CAS is located in Columbus, Ohio and is a division of the American Chemical Society. CAS can be contacted at Chemical Abstracts Service, 2540 Olentangy River Road, P.O. Box 3012, Columbus, Ohio 43210 (E-mail: help@cas.org).

Online searching means using a computer terminal to search a *database*. Although databases in chemistry are available from several organizations, STN® International (The Scientific & Technical Information Network) is important because it is comprehensive and available in many countries. STN® has dozens of databases, including many that cover chemistry and chemical engineering. To access these databases a chemistry department, a library, or an individual subscribes to STN® (for a nominal fee), and receives code numbers that will permit access to the system. Then all one needs is a computer and a modem. STN® charges for each use, depending on which databases are used, for how long, and what kind of information is requested. One of the nice features of STN® is that the same command language is used for all databases, so when one has mastered the language for one database, one can use it for all the others. In this section, we will discuss literature searching using *CAS* databases online, which is one of the databases available from STN. One thing that must be remembered is that *CAS databases online* is complete only from 1967 to the present,[49] so that searches for earlier abstracts must use the printed volumes. However, for the period since 1967, not only is online searching a great deal faster than searching the printed *CA*, but, as we will see, one can do kinds of searches online that are simply not possible using only the printed volumes. Furthermore, the on-line files are updated every two weeks, so that one will find all the abstracts on-line well past the appearance of the latest semiannual indexes, often even before the library has received the latest

[47] http://ptcl.chem.ox.ac.uk/MSDS/glossary/casnumber.html
[48] http://www.cas.org/EO/checkdig.html
[49] There is also a file called CAOLD that has some papers earlier than 1967.

weekly printed issue of *CA*. The *CAS databases online* is extremely flexible; one can search in a great many ways. It is beyond the scope of this book to discuss the system in detail (*CA* conducts workshops on its use), but even with the few commands we will give here, a user can often find all that he or she is looking for. The *CAS databases online* has two major files, *the CA File* and *the Registry File*.[50] T

SciFinder®: A Search Tool for Exploring CAS Databases[51]

Tutorials are available to help use SciFinder®,[52] which is a searching tool and not the CAS database. SciFinder® can search a research topic[53] or a compound can be searched by structure.[54] Another search engine is available, different from SciFinder®, known as STN Express® with Discover!,[55] and this searching tool can also be used to search CAS databases.[56] The Analysis Edition of STN Express® with Discover! allows one to search, analyze, visualize, and discover sci-tech information by the ability to create a table for substance analysis that identifies the common substructure for an answer set of structurally related substances,; Group related author–inventor names and company names for better analysis and visualization results; Analyze and tabulate data from single- or multi-file search results, and create a data table and 3D chart; Save an answer set from databases such as CAplusSM, PCTFULL, and USPATFULL with the Save for STN® AnaVist Wizard, and then import and open it in STN® AnaVistTM; Create an interactive spreadsheet from all or only hit CAS Registry Number®s and their corresponding CAS Roles through the CAS Registry Number®; Upload lengthy genetic sequences automatically for searching in DGENE and PCTGEN via the Upload Query Wizard. STN Express® was developed in collaboration with Hampden Data Services. Note that the CAplus database makes it possible to see not only what a paper has cited, but also what papers it been cited by.

To illustrate how STN® is used, an on-line tutorial is available.[57] A few on-line windows from a SciFinder® search are provided to illustrate how searches can be done. This presentation is by no means complete or intended as an alternative to the actual tutorial. Indeed, one could *not* use SciFinder® properly after simply reading this discussion. The intent is to illustrate some features that are available and to present an overview of the use of this important tool.

[50]There is also a file, LCA, which is used for learning the system. It includes only a small fraction of the papers in the CA File, and is not updated. There is no charge for using the LCA File, except for a small hourly fee.

[51]http://www.cas.org/. For a tutorial, see http://www.cas.org/SCIFINDER/citation.html.

[57]http://www.cas.org/ONLINE/STN/expressmac.pdf

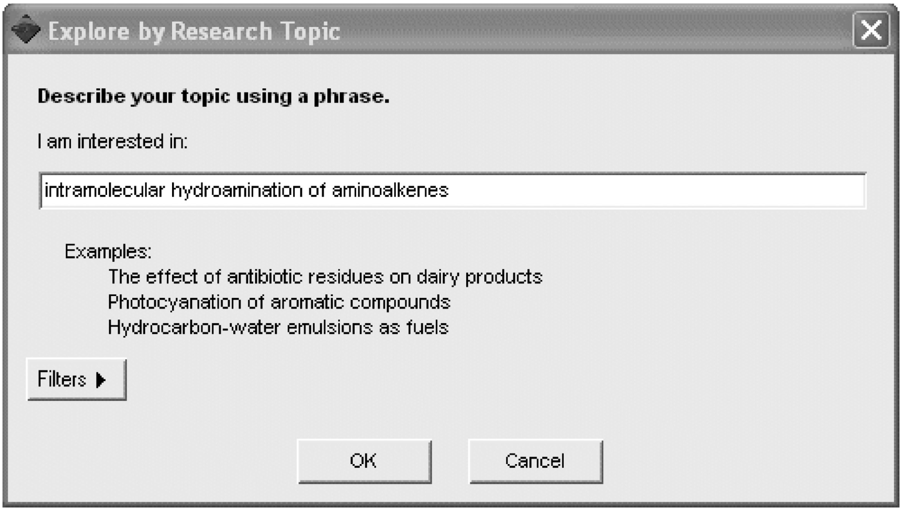

Fig. A.3. Explore by research topic.

Using SciFinder®, a search can be done in one of several different ways. In one example, a search is done by research topic:[58] The example shown in Fig. A.3 shows a search for intramolecular hydroamination of aminoalkenes. To begin, click Explore by research topic and enter the appropriate information.

It is possible to use filters (see Fig. A.3) in order to refine the search by year, document type (journal, patent, review, etc.), author, or company. A window is returned containing references categorized by their relationship to the search phrase, as shown in Fig. A.4. One then simply checks those reference lists that appear closest to the area of interest.

After clicking on ‘‘get references,’’ a screen is returned (Fig. A.5) that has the original references as shown in the window. One is given the option of refining this list further, and for each reference, most browsers allow viewing of the abstract or the full references as an HTML or a pdf file. Two icons appear beside each reference in the list: a microscope, which can be clicked on to see the abstract, and an document icon that can be clicked on to see the full-text, original article on the publisher's web-site. This feature is an alternative to document delivery in the traditional sense.

Other examples of typical searches allowed by SciFinder® include search by authors name, as with Professor K. Barry Sharpless shown in Fig. A.6. Search by structure is also possible, such as the one shown in Fig. A.7, and the program provides drawing tools. SciFinder® then searches to finds matches based on structure or reaction.

It is also possible to using the drawing tools to search by reaction and reaction type. SciFinder® returns reaction information, such as that shown in Fig. A. 8. In

[58]http://www.cas.org/SCIFINDER/topic.html

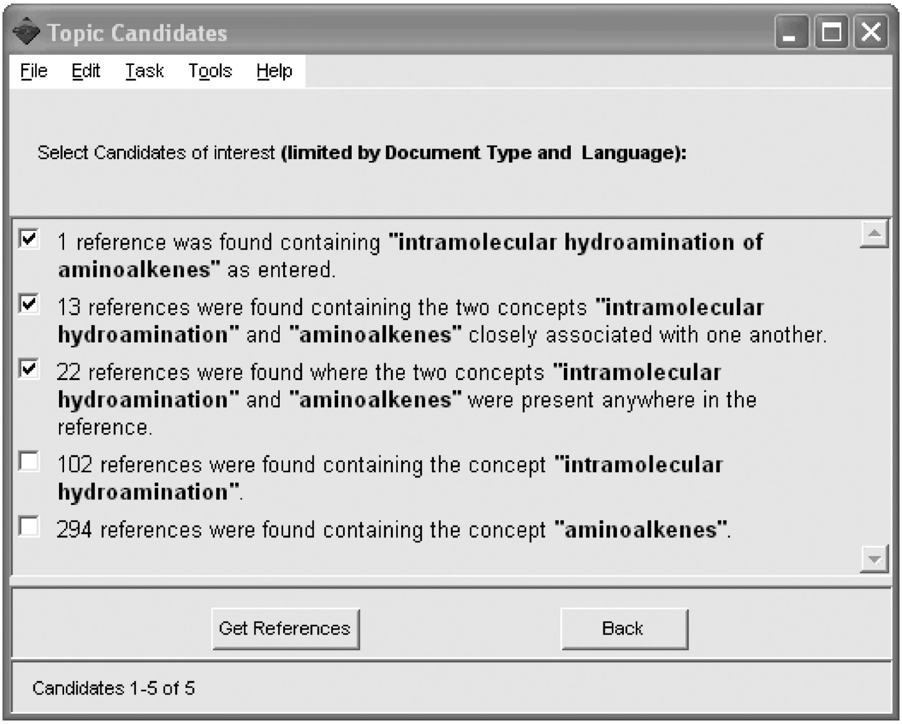

Fig. A.4. Selection of candidates of interest for search by research topic.

all cases, journal articles and/or patents are returned that provide direct access to the literature of interest.

Science Citation Index

As seen in the SciFinder® search tutorials, it is possible to track papers that have cited a particular article or author. A publication that can greatly facilitate literature searching is *Science Citation Index (SCI)*, begun in 1961. This publication, which is quite different from any other mentioned in this chapter, gives a list of all papers in a given year that have cited a given paper, patent, or book. Its utility lies in the fact that it enables the user to search *forward* from a given paper or patent, rather than backward, as is usually the case. For example, suppose a chemist is familiar with a paper by Jencks and Gilchrist (*J. Am. Chem. Soc.,* ***1968***, *90*, 2622) entitled "Nonlinear Structure–Reactivity Correlations. The Reactivity of Nucleophilic Reagents toward Esters." The chemist is easily able to begin a search for earlier papers by using references supplied in this paper, and can then go further backward with the aid of references in those papers, and so on. But for obvious reasons, the paper itself supplies no way to locate *later* papers.

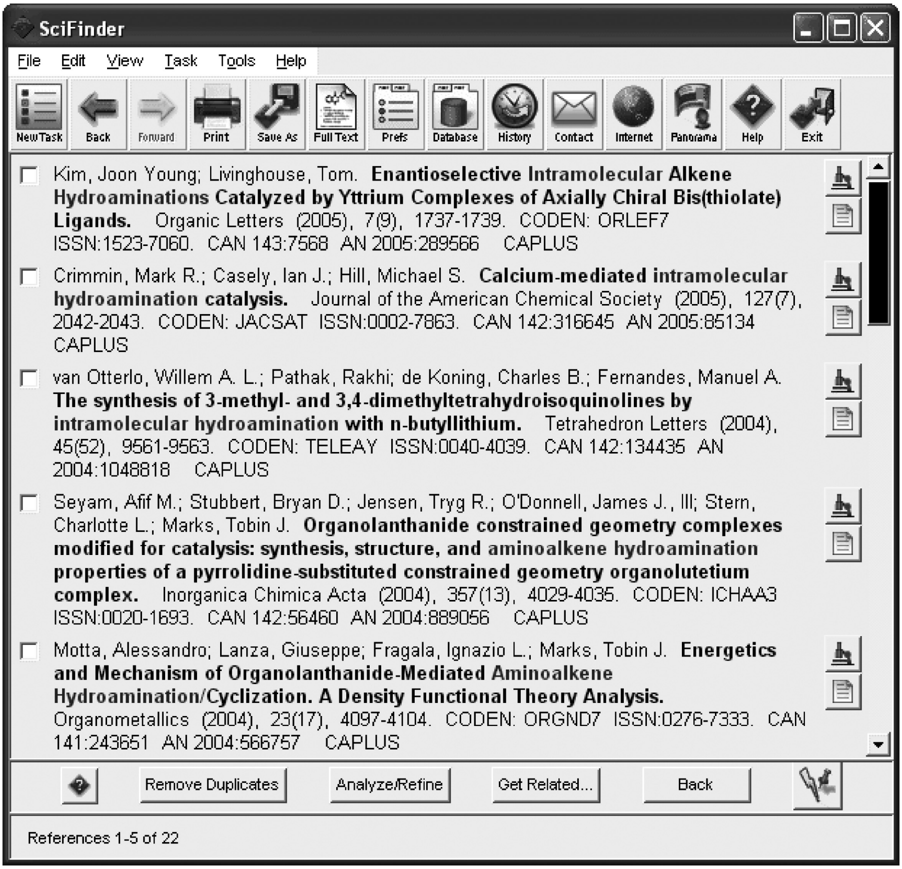

Fig. A.5. Original literature references returned for search by research topic.

The *SCI* is designed to make up for this gap. The citation index of *SCI* lists all papers, patents, or books cited in a given year or 2-month period (by first author only) and then gives a list of papers that have done the citing. The index is published bimonthly and cumulated annually. For example, column 43,901 of the 1989 citation index shows that the Jencks paper mentioned above was cited as a footnote in 16 papers published in 1989. It is reasonable to assume that most of the papers that cited the Jencks paper were on closely related subjects. For each of the 16 papers are listed the first author, journal abbreviation, volume and page numbers, and year. In a similar manner, if one consulted *SCI* for all the years from 1968 on, one would have a complete list of papers that cited that paper. One could obviously broaden the search by then consulting *SCI* (from 1989 on) for papers that cited these 16 papers, and so on. Papers, patents, or books listed, for example, in the 1989 *SCI* may go back many years (e.g., papers published by Einstein in 1905 and 1906 are included). The only

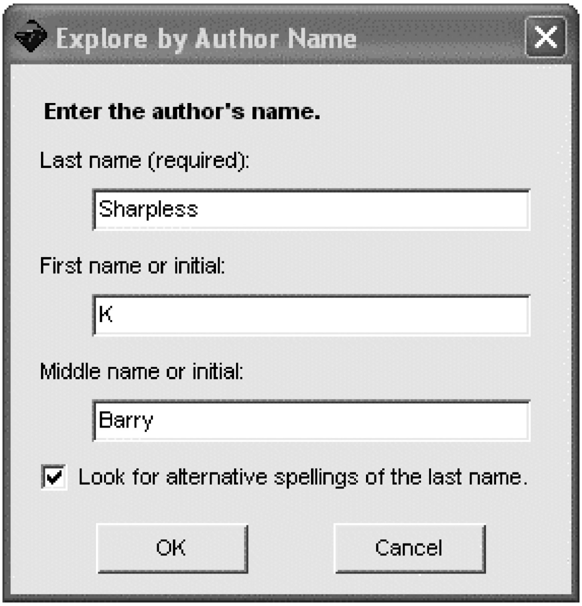

Fig. A.6. Screen shot for beginning a search by author.

requirement is that a paper published in 1989 (or late 1988) has mentioned the earlier paper in a footnote. The arrangement of cited papers or books is alphabetical by cited first author and then by cited year. Cited patents are listed in a separate table, in order of patent number, though the inventor and country are also given.

The *SCI* covers ∼3200 journals in the physical and biological sciences, as well as in medicine, agriculture, and technology. In addition to the citation index, each bimonthly and annual *SCI* also includes three other indexes. One of these, called *Source Index*, is similar to the *CA* author index. It lists the titles, journal abbreviations, volume, issue, page numbers, and year of all papers published by a given author during that 2-month period or year. All authors are listed; not just first authors. The second, called the *Corporate Index*, lists all publications that have been published from a given institution during that period, by first author. Thus, the corporate index for 1989 lists 63 papers by 45 different first authors emanating from the Department of Chemistry of Rutgers University, New Brunswick, NJ. The main section of the corporate index (the Geographic Section) lists institutions by country or (for the U.S.) by state. There is also an Organization Section, which lists the names of institutions alphabetically, and for each gives the location, so it can be found in the geographic section. The third index included in *SCI* is the *Permuterm*[59] *Subject Index*. This index alphabetically lists every significant word in the titles of

[59]Registered trade name.

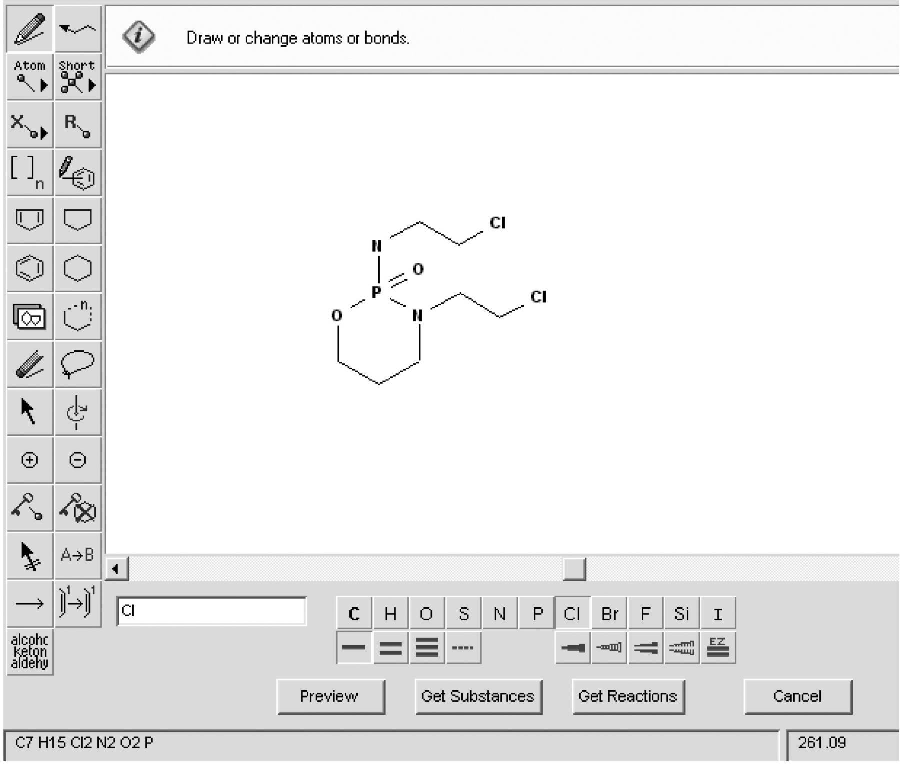

Fig. A.7. Screen shot for beginning a search by structure, using the drawing tools.

all papers published in that year or bimonthly period, paired with all other significant words in the same title. Thus, for example, a title with seven significant words appears at 42 separate places in the index. Each of the seven words appears six times as the main word, each time paired with a different word as the coword. The user is then led to the *Source Index*, where the full reference is given. The *SCI* is also available on-line (though not through STN) and on CD ROM disks. A version of *SCI* that is restricted to chemistry, but also includes searchable abstracts, is available only in the CD ROM format.

The publishers of *SCI* also produce another publication, called *Index to Scientific Reviews*, that appears semiannually. This publication, which began in 1974, is very similar to *SCI*, but confines itself to listing citations to review articles. The citations come from ~2500 journals in the same general areas as are covered by *SCI*. The review articles cited appeared in ~215 review journals and books, as well as in those journals that publish occasional review articles. Like *SCI*, the *Index to Scientific Reviews* contains citation, source, corporate, and Permuterm indexes. It also contains a "Research Front Specialty Index," which classifies reviews by subject.

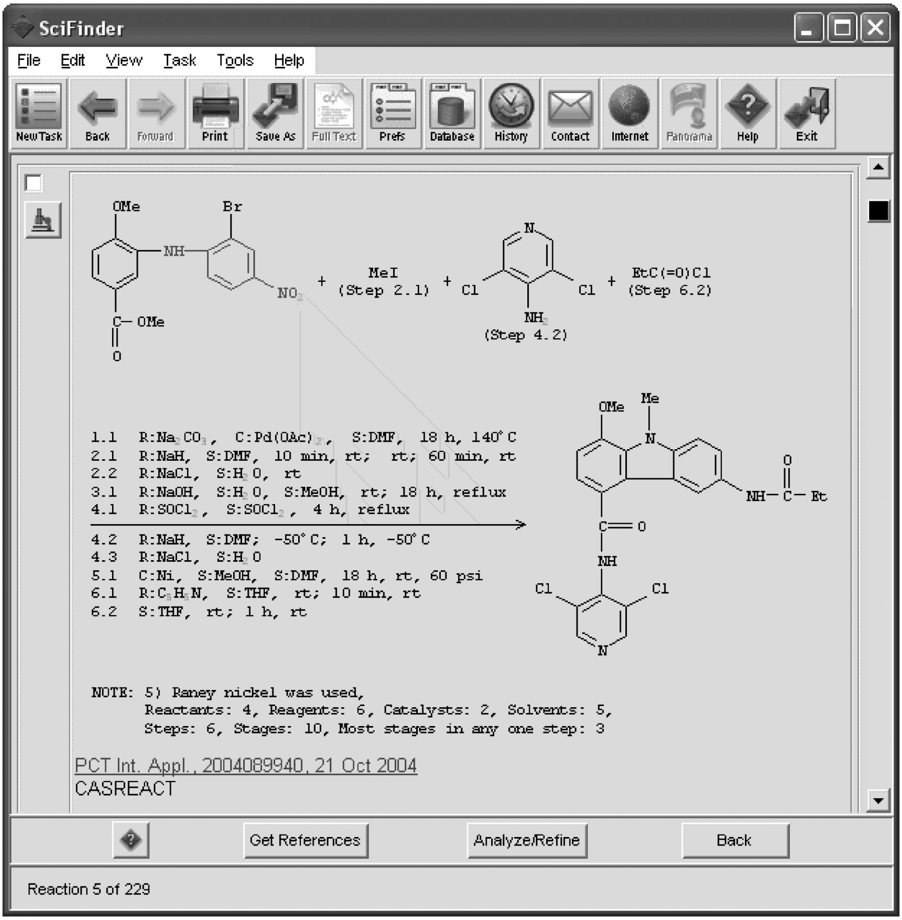

Fig. A.8. Screen shot of results for a search by reaction, using the drawing tools.

How to Locate Journal Articles

Having obtained a reference from various sources or searches, one often needs to consult the original journal (the location of patents is discussed on p. $$$). The first step is to ascertain the full name of the journal, since it is the abbreviation that is generally given. Of course, everyone should be familiar with the abbreviations of the very important journals, such as *J. Org. Chem.*, *Angew. Chem. Int. Ed.*, and so on, but references are often found to journals whose titles are not at all familiar (e.g., *K. Skogs Lantbruksakad. Tidskr.* or *Nauchn. Tr. Mosk. Lesotekh. Inst.*). In such cases, one consults the *Chemical Abstracts Service Source Index (CASSI)*, with the most recent abbreviations in bold print. *CASSI* is available in a 1907–2004 cumulative, containing information 80,000 serial and nonserial publications. *CASSI* also lists journals covered by *Chemisches Zentralblatt* and its predecessors

from 1830 to 1969, and journals cited in *Beilstein* before 1907. The journals are listed in alphabetical order of the *abbreviations*, not of the titles. Journal title changes have not been infrequent, and *CASSI* also contains all former names, with cross-references to the current names. Quarterly supplements, cumulated annually, to *CASSI* have appeared since 1990 listing new journals and recent changes in journal titles. It should be pointed out that, while many publications use the *CA* abbreviations, not all do. The student will find that usage will vary from country to country, and even from journal to journal within a country. Furthermore, the *CA* abbreviations have changed from time to time. Articles can be accessed directly from SciFinder® using the CAS ChemPort feature.[60]

Once the complete title is known, the journal can easily be obtained if it is in the library customarily used by the chemist. If not, one must use another library, and the next step is to find out which libraries carry the journal. *CASSI* answers this question too, since it carries a list of some 360 libraries in the United States and other countries, and *for each journal it tells which of these libraries carries it*, and furthermore, if the holdings are incomplete, which volumes of that journal are carried by each library. It may be possible to visit the closest library personally. If not, a copy of the article can usually be obtained through interlibrary loan. *CASSI* also includes lists of journal publishers, sales agents, and document depositories. Photocopies of most documents cited in *CA* can be obtained from *Chemical Abstracts*™ Document Delivery Service, Customer Services, 2540 Olentangy River Road, Columbus OH, 43210, U.S. Orders for documents can be placed by mail, telephone, Telex, fax, or on-line through STN® or other services.

These latter comments are largely out of date given the on-line status of most journals. As mentioned above, pdf files of an article can be downloaded, or they can be read directly via the HTML file using any current browser. The reader is encouraged to contact the library person in your establishment that is responsible for chemical literature and to learn which on-line services are available through your local library.

APPENDIX B

Classification of Reactions by Type of Compounds Synthesized

ACETALS

acetals + RM **10-64**
aldehydes + alcohols **16-05**
by transetherification **10-13**
from dihalides **10-8**
from hydroxy-ethers **14-06**
ortho esters + RM **10-64**
reductive cleavage of ortho esters **19-56**

ACYLALS (DIESTERS)

aldehydes + anhydrides **16-06**

ACYLOINS – see hydroxy ketones

ALCOHOLS

addition of other organometallics to carbonyls **16-25**
aldehydes + allylic silanes **16-51**
alkenes + alcohols **15-33**
alkenes + aldehydes or ketones **16-54**
alkenes-oxymercuration **15-03**
amides + organometallic compounds **16-82**
amines + KOH **10-23**
anhydrides + organometallic compounds **16-82**
arylation of ketones **11-12**
boranes + CO–oxidation **18-23**
boranes + CO–reduction **18-24**
by the Cannizzaro reaction **19-81**
by Wittig rearrangement **18-21**
cleavage of ethers **10-49**
condensation of aldehydes **19-81**
conjugate reduction **15-14**
carboxylic esters + organometallics **16-82**
epoxides + organometallics **10-65**
epoxides + silanes **10-55**
from boranes **10-01**
from boronates **18-23**
Grignard addition to aldehydes or ketones **16-24**
hydration of alkenes **15-03**
hydrolysis of acetals and ketals **10-06**
hydrolysis of alkyl halides **10-01**
hydrolysis of inorganic esters **10-04**
hydrolysis of sulfonate esters **10-04**
hydrolysis of vinyl ethers **10-06**
hydroxylation at aliphatic carbon **19-14**
hydroxymethylation of arenes **11-12**
organolithium addition to aldehydes or ketones **16-24**
oxidation of boranes **12-27**
oxidation of boranes **15-16**
oxidation of methylene **19-15**

March's Advanced Organic Chemistry: Reactions, Mechanisms, and Structure, Sixth Edition, by Michael B. Smith and Jerry March
Copyright © 2007 John Wiley & Sons, Inc.

oxidation of silanes **10-16**
radical addition to carbonyl compounds **16-56**
rearrangement of ethers **18-22**
rearrangement of peroxides **18-20**
reduction of acyl halides **19-63**
reduction of aldehydes or ketones **19-36**
reduction of carbonyls with Grignard reagents **16-24**
reduction of carboxylic acids **19-37**
reduction of carboxylic esters **19-38**
reduction of carboxylic esters **19-65**
reduction of epoxides **19-35**
reduction peroxides **19-60**
ring expansion of amines **18-03**
silanes + aldehydes or ketones **16-26**

ALCOHOLS, ALLYLIC
addition of allylic organometallics to carbonyls **16-25**
alkenes + formaldehyde **16-54**
allylic silanes + aldehydes or ketones **16-26**
deprotonation of epoxides **17-03**
rearrangement of alkene-sulfoxides **18-35**

ALDEHYDES
alkenes + aldehydes **15-33**
alkyl halides + organoiron compounds **10-76**
alkylation of aldehydes **10-68**
alkylation of imines **10-68**
alkylation reactions **10-67**
and keto-enol tautomerism **12-03**
aromatic compounds + chloroform **11-18**
aromatic compounds + formaldehyde **11-18**
aromatic compounds + formamides **11-18**
aromatic compounds + halo-ethers **11-18**
arylation of aldehydes **13-14**
boranes + MeO(ArS)CH_2Li **18-24**
by decarboxylation **12-40**
by Michael addition **15-24**
by rearrangement of aldehydes **18-04**
by the Wacker process **19-25**
carbonylation of aromatic compounds **11-18**
carbonylation of hydrocarbons **12-33**
formylation of aromatic compounds **11-18**
from aryl imines **11-18**
from dihydrooxazines **10-72**
from dithioaldehydes **16-11**
hydroformylation **15-37**
hydrolysis of acetals **10-06**
hydrolysis of C=N compounds **16-02**
hydrolysis of *gem*-dihalides **10-02**
hydrolysis of nitro compounds **16-03**
hydrolysis of vinyl ethers **10-06**
oxidation of alcohols **19-03**
oxidation of aryl methyl groups **19-18**
oxidation of nitro compounds **19-21**
oxidation of primary alkyl halides **19-20**
oxidative cleavage of diols **19-07**
oxidative cleavage of epoxides **19-07**
ozonolysis of alkenes **19-09**
reduction anhydrides **19-40**
reduction nitriles **19-44**
reduction of acyl halides **19-39**
reduction of acyl halides **19-40**
reduction of amides **19-41**
reduction of carboxylic acids **19-40**
reduction of carboxylic esters **19-40**

ALKANES
addition of alkanes to alkenes **15-18**
alcohols + RM **10-63**
alkenes + diimide **15-12**
alkenes + metals **15-12**
alkenes + organometallics **15-21**
alkyl halides + metals **10-56**
alkyl halides + metals **10-56**
alkyl halides + organocuprates **10-58**
alkyl halides + RM (Li, Na, K) **10-57**

alkyl halides + RM (other metals) **10-59**
alkyl halides + silanes **10-55**
Barton–McCombie reaction **19-58**
by decarboxylation **12-40**
by [3+2]-cycloaddition **15-59**
cleavage of alkanes **12-47**
cleavage of ketones **12-46**
coupling of boranes **14-26**
coupling of carboxylate salts **14-29**
coupling of Grignard reagents **14-24**
coupling of organocuprates **14-25**
coupling of two alkanes **14-15**
decarbonylation of aldehydes **14-32**
decyanation **12-48**
from alcohols **19-58**
from alkylborates **10-59**
from boranes **10-59**
hydrogen exchange **12-01**
hydrogenation of alkenes **15-11**
hydrogenation of alkynes **15-11**
hydrogenation of aromatic compounds **15-13**
inorganic esters + RM **10-61**
insertion by carbenes **12-21**
pyrolysis of peroxides **17-37**
radical addition to alkenes **15-29**
radical coupling of alkanes **14-14**
radical cyclization of alkenes **15-30**
reduction dithioketals **10-71**
reduction of acyl halides **19-59**
reduction of alkyl halides **19-53**
reduction of carbonyls to methylene **19-61**
reduction of nitro compounds **19-67**
reduction of silanes **19-52**
reduction of sulfonate esters **19-57**
reduction of sulfur compounds **19-70**
reduction of thioethers **14-27**
reduction of thiols **14-27**
reduction of thiols **19-70**
reduction of xanthate esters **19-58**
reductive cleavage of cyclopropanes **15-15**
reductive cleavage of ethers **19-56**
replacement of metals in RM by hydrogen **12-24**
σ-bond rearrangements **18-38**
sulfonate esters + metals **10-56**
sulfonate esters + organocuprates **10-58**
sulfonyl compounds + organometallics **10-61**
via transmetallation **12-22**

ALKENE-ALCOHOLS

rearrangement of alkene-ethers **18-35**

ALKENE-ALDEHYDES

Claisen rearrangement **18-33**
Cope rearrangement **18-32**
rearrangement of allyl vinyl ethers **18-33**

ALKENE-ALKYNES

addition of alkynes to alkynes **15-20**

ALKENE-AMINES

rearrangement of alkene-ammonium salts **18-35**

ALKENE-CARBOXYLIC ACIDS

Claisen rearrangement **18-33**
rearrangement of alkene-esters **18-33**

ALKENE-KETONES

Claisen rearrangement **18-33**
rearrangement of allyl vinyl ethers **18-33**

ALKENE-THIOETHERS

rearrangement of alkene sulfonium salts **18-35**

ALKENES

1,3-elimination of diols **17-25**
1,3-elimination of halo-amines **17-25**
1,3-elimination of halohydrins **17-25**
addition of alkanes to alkynes **15-18**
addition of alkenes to alkenes **15-20**

aldehydes or ketones + active H compounds **16-38**
alkene metathesis **18-37**
alkenes + arylboronic acids **13-10**
alkenes + aryldiazonium compounds **13-10**
alkenes + carbenes **15-64**
alkenes + carbocations **12-20**
alkynes + aryl halides + RM (M = metal) **15-22**
alkynes + metals or metal hydrides **15-12**
allylic halides + metals **10-56**
allylic silanes + esters **10-60**
base induced elimination of halo-sulfones **17-20**
base induced elimination of sulfonyl hydrazones **17-11**
base-induced elimination of ammonium salts **17-08**
base-induced elimination of halides **17-13**
base-induced elimination of sulfonate esters **17-06**
base-induced elimination of sulfonyl halides **17-14**
bis-decarboxylation of dicarboxylic acids **19-13**
by decarboxylation **12-40**
by McMurry coupling **19-77**
by Peterson alkenylation **16-41**
by the Diels–Alder reaction **15-60**
by the ene reaction **15-23**
by the Heck reaction **13-10**
by the heteroatom Diels–Alder reaction **15-61**
by the Horner–Wadsworth–Emmons reaction **16-44**
by the Knoevenagel reaction **16-38**
by the Ramberg–Bäcklund reaction **17-20**
by the Sakurai reaction **15-26**
by the Wittig reaction **16-44**
by [2+2]-cycloaddition **15-63**
by [3+2]-cycloaddition **15-59**
cleavage of ethers **17-02**
cleavage of vinyl ethers **17-02**
conjugated addition of allylsilanes **15-26**
deacyloxylation **19-59**
decarbonylation of acyl halides **17-17**
decarboxylation of hydroxy-carboxylic acids **17-26**
dehydration of alcohols **17-01**
dehydrogenation **19-02**
deoxygenation of 1,2-diols **17-18**
diazoalkanes + aldehydes **15-64**
dimerization of alkyl halides **19-32**
elimination of 1,2-dihalides **17-22**
elimination of boranes **17-15**
elimination of halo-ethers **17-24**
enamines + boranes **15-16**
esters + organometallics **10-60**
extrusion from oxathiolanes **17-38**
extrusion of CO from cyclic ketones **17-35**
fro episulfones **16-48**
from bis(xanthates) **17-18**
from boranes **10-59**
from carbenes **12-21**
from dienes **18-37**
from epoxides or thiiranes **17-03**
from imines **16-44**
hydroboration of alkynes **18-25**
hydrogenation of alkynes **15-11**
hydrogenation of aromatic compounds **15-13**
isomerization of double bonds **15-01**
ketones or aldehydes + bis-Grignards **16-24**
migration of boranes **12-02**
migration of double bonds **12-02**
nitrosation of aziridines **17-21**
organometallics + ketones **16-25**
organometallics + tosylhydrazones **16-38**
other cycloaddition reactions **15-66**
oxidative decarboxylation of carboxylic acids **19-12**

Petasis alkenylation **16-45**
protonolysis of vinyl boranes **18-25**
protonolysis of vinyl boranes **18-26**
pyrolysis of amine oxides (Cope) **17-09**
pyrolysis of ammonium salts (Hofmann) **17-07**
pyrolysis of β-lactones **17-26**
pyrolysis of esters **17-04**
pyrolysis of hydroxy-alkenes **17-32**
pyrolysis of sulfones **17-12**
pyrolysis of sulfoxides **17-12**
pyrolysis of thionocarbonates **17-19**
pyrolysis of xanthates (Chugaev) **17-05**
reduction of alcohols **19-54**
reduction of amines **19-67**
reduction of carboxylic esters **19-65**
reduction of enamines **19-67**
reduction of nitriles **19-66**
reduction of thiiranes **19-35**
reduction of thiophene derivatives **19-70**
reduction of vinyl halides **19-53**
reduction of vinyl imines **19-61**
reductive coupling of aldehydes or ketones **19-77**
reductive coupling of epoxides **19-35**
sigmatropic carbon migration **18-30**
sigmatropic H migration **18-29**
silyl-organometallics + aldehydes or ketones **16-41**
Tebbe alkenylation **16-45**
vinyl boranes + halogen/base **18-25**
vinyl halides + arylboronic acids **13-10**
vinyl-cyclopropane rearrangement **18-31**
vinyl-X + alkyl(aryl)boronic acids **12-15**
Wagner–Meerwein rearrangement of alcohols **18-01**
Wagner–Meerwein rearrangement of halides **18-01**

ALKYNE-ALCOHOLS
addition of alkynes to carbonyls **16-25**

ALKYNES
alkyl halides + alkyne anions **10-74**
alkyl halides + propargylic RM **10-57**
alkynes + aryliodonium salts **13-13**
alkynes + boranes **18-26**
aryl halides + alkyne-M (M = a metal) **13-13**
aryl halides + alkynes **10-74**
base-induced elimination of dihalo compounds **17-16**
base-induced elimination of halides **17-13**
by Sonogashira coupling **13-13**
dimerization of dihalides **19-32**
elimination of alkenes **17-16**
hypervalent iodine + alkyne-M (M = a metal) **12-26**
metathesis of **18-37**
pyrolysis of bis(ammonium salts) **17-07**
pyrolysis of thiirene dioxides **17-20**
pyrolysis of ylids **17-10**

ALLENES
base-induced rearrangement of halocyclopropanes **18-03**
by Claisen rearrangement **18-33**
by the Wittig reaction **16-44**
Cope rearrangement of di-yens **18-32**
elimination of dihalides **17-22**
propargylic esters + organocuprates **10-60**
reduction of alkynes **19-53**

ALLOPHANATES
carbamates + isocyanates **16-08**

AMIDE-ESTERS
aziridines + amides **10-14**

AMIDES
acyl halides + ammonia or amines **16-72**
addition of organometallics to isocyanates **16-33**

alcohols + cyanogen halides **16-09**
aldehydes + ammonia + oxidant **14-11**
alkanes + nitriles **14-12**
alkenes + amides **15-09**
alkenes + nitriles **16-91**
alkyl halides + amides **10-41**
alkylation of amides **19-73**
amides + aldehydes **10-41**
amides + amines **16-76**
amines + CO + alkenes **15-36**
amines + CO **12-53**
amines + haloformates **10-53**
amines + organoiron compounds **10-77**
amines + vinyl esters **16-75**
anhydrides + ammonia or amines **16-73**
aromatic compounds + amides **11-22**
aromatic compounds + hydroxamic acids **11-06**
aromatic compounds + isocyanates **11-21**
aryl halides + amides **10-41**
aryl halides + amides **13-05**
aryl halides, DMF and $POCl_3$ **11-21**
by Beckmann rearrangement **18-17**
by Michael addition **15-24**
by the Willgerodt reaction **19-84**
carboxylic acids + amino-boranes **16-74**
carboxylic acids and ammonia or amines **16-74**
carboxylic esters + ammonia or amines **16-75**
cleavage of ketones **12-46**
condensation of methyl ketones **19-84**
from alcohols **10-41**
hydrolysis of isonitriles **16-97**
hydrolysis of nitriles **16-04**
imines + borane + CO **12-33**
insertion of acyl nitrenes **12-13**
insertion of diazo amides **12-21**
ketenes + amines **15-08**
ketones + HN_3 **18-16**
N-alkylation **10-41**
N-arylation **10-41**
nitriles + alcohols **16-91**
nitriles + amines **16-21**
oxidation of methylene in amines **19-17**
oxidation of methylene in lactams **19-17**
oximes + halogenating or oxidizing agents **18-17**
pyrolysis of imino esters **18-42**
rearrangement of oximes **18-17**
reduction of imides **19-64**
transamidation **16-70**

AMIDINES
ketenimines + amines **15-08**
nitriles + ammonia or amines **16-21**

AMINE OXIDES
oxidation of amines **19-29**

AMINES
addition of organometallics to C=N compounds **16-31**
addition of silanes to C=N **16-31**
alkenes + amines or ammonia **15-08**
alkyl halides + amines **10-31**
alkylation of amines **10-31**
alkylation of formamidines **10-71**
alkylation of nitroso amines **10-71**
amides + organometallic compounds **16-82**
amination of active methylene compounds **12-12**
amination of alkanes **10-39**
amination of alkanes **12-12**
amination of methylene **19-16**
amines + aryl halides **13-05**
amines + diaryliodonium compounds **11-06**
amines + diazo compounds **10-34**
aminomethylation of aromatic compound **11-22**
aromatic compounds + amide bases **13-18**

aromatic compounds + aryl azides **11-06**
aromatic compounds + halo-amines **11-06**
aromatic compounds + hydrazoic acid **11-06**
aryl halides + alkyl organometallics **13-05**
aryl halides + hydroxylamine-*O*-sulfonic acid **18-15**
azides + haloboranes **12-32**
aziridines + RM **10-66**
boranes + ammonia + NaOCl **12-32**
boranes + chloramine **12-32**
by the Stevens rearrangement **18-21**
by transamination **10-33**
Curtius rearrangement **18-14**
cyclization of halo-amines **18-40**
dealkylation of amines **19-73**
displacement of cyano **10-62**
diynes + amines **15-08**
enamines + boranes **15-16**
from alcohols **10-31**
from alcohols **10-32**
from amides **18-13**
from amines **10-33**
from amino-nitriles **10-62**
from boranes **10-31**
from cyanohydrins **10-32**
from ethers **10-32**
from halo-amines **10-31**
Hofmann rearrangement **18-13**
hydrolysis of isocyanates **18-13**
hydrolysis of isocyanates **18-15**
hydrolysis of isocyanates **18-16**
hydroxylamines + alkyl organometallics **12-32**
insertion of nitrenes **12-13**
Lossen rearrangement **18-15**
Michael addition with *N* nucleophiles **15-31**
phenols + amines or ammonia **13-06**
radical addition to C=N compounds **16-56**
rearrangement of ammonium salts **13-31**
rearrangement of ammonium salts **18-21**
rearrangement of aryl hydroxylamines **13-32**
reduction nitroso compounds **19-47**
reduction of amine oxides **19-68**
reduction of amines **19-64**
reduction of azides **19-50**
reduction of azo compounds **19-74**
reduction of azoxy compounds **19-74**
reduction of C=N compounds **19-42**
reduction of hydrazines **19-74**
reduction of hydroxylamines **19-47**
reduction of isocyanates **19-51**
reduction of isothiocyanates **19-51**
reduction of lactams **19-64**
reduction of nitriles **19-43**
reduction of nitro compounds **19-45**
reduction of nitroso-amines **19-51**
reduction oximes **19-48**
reductive alkylation of aldehydes or ketones **16-17**
Schmidt reaction **18-16**

AMINO-ACIDS
lactones + ammonia or amines **16-75**

AMINO-ALCOHOLS : see hydroxy-amines

AMINO-ALDEHYDES
aldehydes + C=N compounds **16-31**

AMINO-ESTERS
diazoesters + amines **15-64**

AMINO-ETHERS
aziridines + alcohols **10-14**

AMINO-KETONES
base-induced rearrangement of sulfonyl oximes **18-12**
ketones + HCHO + amines **16-19**
Mannich reaction **16-19**

AMINO-NITRILES
from cyanohydrins **10-32**
HCN or cyanide + C=N compounds **16-53**

AMINO-THIOETHERS
alkenes + sulfonamides **15-55**
alkenes + sulfonium salts + amines **15-55**

AMINO-THIOLS
episulfides + amines or ammonia **10-35**

AMMONIUM SALTS
alkyl halides + amines **10-31**

ANHYDRIDES
acyl halides + carboxylic acids **16-66**
aldehydes + acyl peroxides **14-09**
carboxylic acids + vinyl esters **16-67**
dehydration of carboxylic acids **16-67**
dehydration of dicarboxylic acids **16-67**

ANHYDRIDES, ORGANIC–INORGANIC
anhydrides + mineral acids **16-68**

ARENES
α-halo ketones + organocuprates **10-58**
alkyl halides + ArM (Li, Na, K) **10-57**
alkyl halides + aryl-M (M = a metal) **13-17**
alkyl halides + arylboronic acids **13-09**
alkyl halides + organocuprates **10-58**
alkyl halides + aryl organometallics **10-57**
aromatic compounds + active H compounds **13-17**
aromatic compounds + acylperoxides **14-17**
aromatic compounds + alcohols **11-11**
aromatic compounds + alkenes **11-11**
aromatic compounds + alkyl halides **11-11**
aromatic compounds + carboxylic acids **14-19**
aromatic compounds + ketones **11-12**
aryl halides + active methylene compounds **13-14**
aryl halides + alkenes **13-10**
aryl halides + alkenes **15-21**
aryl halides + alkynes **15-21**
aryl halides + organocuprates **10-58**
aryl halides + RM (other metals) **10-59**
aryl halides + vinylboronic acids **13-09**
aryl halides + trifluoroborates **13-09**
aryldiazonium salts + alkenes **13-25**
aryldiazonium salts + alkenes **13-26**
aryldiazonium salts + alkyl organometallics **13-25**
by decarboxylation **12-40**
by radical cyclization **15-30**
coupling of aromatic compounds **11-15**
cyclodehydration of carbonyl compounds **11-13**
Friedel–Crafts alkylation **11-11**
from alkylborates **10-59**
from boranes **10-59**
hydrogen exchange **11-01**
rearrangement of *N*-alkyl aryl amines **11-32**
replacement of aryl nitro **13-29**

AROMATIC COMPOUNDS
aromatic compounds + carbenes **15-64**
aromatization of six-membered rings **19-01**
cleavage of arenes **11-33**
cleavage of aryl alkyl ethers **11-37**
cyclization of ene-diynes **18-27**
cyclotrimerization of alkynes **15-65**
deamination of aromatic compounds **19-69**
decarbonylation of aryl aldehydes **11-34**
decarboxylation of aryl carboxylic acids **11-35**

dehalogenation of aryl halides **11-39**
dehydrogenation of cyclic alkanes **19-01**
desulfonylation of aryl sulfonic acids **11-38**
from aromatic compounds **18-28**
protonation of aryl organometallics **11-41**
pyrolysis of bicyclic dienones **17-28**
reduction aryl diazonium salts **19-69**
reduction of phenols **19-55**
reduction of quinones **19-01**

AZIDES
aldehydes + metal azides **16-78**
alkenes + hydrazoic acid **15-10**
alkenes + metal azides **15-53**
amides + sulfonyl azides **12-11**
from acyl halides **10-43**
from alkyl halides **10-43**
hydrazines + HONO or nitrosyl compounds **12-49**

AZIDO-ALCOHOLS
from epoxides **10-43**

AZIDO-AMINES
from aziridines **10-38**

AZIRIDINES
alkenes + alkyl azides **15-54**
alkenes + halogen + haloamines **15-54**
C=N compounds + sulfur ylids **16-47**
extrusion of nitrogen from triazolines **17-34**
form halo-amines **10-31**
from allene amides **15-09**
from azido-alcohols **10-43**
from epoxides **10-36**
from halo-azides **15-45**
from hydroxy-amines **10-32**
from imines **16-32**
from triazolines **15-58**
imines + diazo compounds **16-32**

AZIRINES
alkynes + amino-nitrenes **15-54**

AZO COMPOUNDS
aryl amines + nitroso compounds **13-24**
aryl diazonium salts + aromatic compounds **11-04**
from aryldiazonium salts **13-28**
oxidation of hydrazines **19-05**
rearrangement of aryl triazenes **11-30**
rearrangement of azoxy compounds **18-43**
reduction of azoxy compounds **19-68**
reduction of nitro compounds **19-80**

AZOXY COMPOUNDS
from alkyl halides **10-45**
nitroso compounds + hydroxylamines **12-51**
reduction of nitro compounds **19-79**

BIARYLS
aromatic compounds + aryl halides ($h\nu$) **14-18**
aromatic compounds + aryl organometallics **11-16**
aromatic compounds + aryl organometallics **14-17**
aromatic compounds + arylboronates **11-16**
aryl halides + alkyl or aryl organometallics **13-09**
aryl halides + aryl organometallics **13-11**
aryl halides + arylboronic acids **13-09**
aryl halides + arylboronic acids **13-12**
aryl halides + trifluoroborates **13-12**
aryldiazonium salts + aromatic compounds **13-27**
arylsulfonic acid + arylboronic acids **13-05**
by benzidine rearrangement **18-36**
by Suzuki–Miyaura coupling **13-12**
coupling 2 aryldiazonium salts **13-28**

coupling aryl halides **13-11**
coupling of aromatic compounds **11-15**
coupling of aryl sulfonates **13-12**
Ullmann coupling **13-11**

BISAMIDES
aldehydes + amides **16-18**

BISULFITES
metal bisulfite + carbonyl compounds **16-12**

BORANES
alkenes + borane or alkyl boranes **15-16**
boranes
thermal migration of boron in boranes **18-11**

BORATES (TRIFLUORO)
boranes + KHF_2 **12-28**

BORATES
alcohols + boranes **12-28**
borates
oxidation of boranes **12-27**

BORONIC ACIDS
alkyl borates + alkyl organometallics **12-28**

BUNTE SALTS
from alkyl halides **10-28**

CARBAMATES
alkyl halides + amines **10-17**
amines + alkyl halides + CO_2 **12-53**
amines + CO_2 **12-53**
from aziridines **12-53**
haloformates + amines **16-72**
isocyanates + alcohols **16-08**

CARBONATES
alcohols + phosphine **16-10**

CARBOXYLIC ACIDS
acyl halides + diazo compounds **18-08**
acyl peroxides + alkyl organometallics **12-26**
alkylation of carboxylic acids **10-70**
aromatic compounds + carbon dioxide **11-20**
aromatic compounds + carbon monoxide **11-20**
aromatic compounds + phosgene **11-19**
aryl nitro compounds + cyanide **13-30**
Barbier–Wieland procedure **19-10**
boranes + ether-acids **18-24**
by decarboxylation **12-40**
by Michael addition **15-24**
carboxylation of alkenes **15-35**
cleavage of diketones **12-43**
cleavage of keto-esters **12-43**
cleavage of ketones **12-45**
cleavage of methyl ketones **12-44**
deacyloxylation **19-59**
esters + metal halides **10-51**
from lactones **10-51**
from RM + arenes **10-57**
hydrolysis of acyl halides **16-57**
hydrolysis of amides **16-60**
hydrolysis of anhydrides **16-58**
hydrolysis of carboxylic esters **16-59**
hydrolysis of diazo ketones **18-08**
hydrolysis of nitriles **16-04**
hydrolysis of ortho esters **10-6**
hydrolysis of trihalide **10-03**
ketones + peroxy acids **18-19**
organometallics + CO_2 **16-30**
oxidation of aldehydes **19-23**
oxidation of aromatic rings **19-10**
oxidation of aromatic side chains **19-11**
oxidation of organoiron compounds **10-77**
oxidation of primary alcohols **19-22**
oxidative cleavage of alkenes **19-10**
oxidative cleavage of alkynes **19-10**
ozonolysis of alkenes **19-09**

phosphoranes + CO_2 **16-44**
pyrolysis of esters **17-04**
rearrangement of ketones **18-19**
via the haloform reaction **12-44**

CARBOXYLIC ESTERS
acyl halides + alcohols **16-61**
acyl halides + ethers **16-61**
alcohols + CO + alkenes **15-36**
alcohols + ketenes **15-05**
alcohols + organoiron compounds **10-77**
alcoholysis of acyl oxazolidinones **16-65**
alcoholysis of amides **16-65**
alcoholysis of nitriles **16-09**
alcoholysis of trihalides **10-03**
aldehydes + acyl halides **16-07**
alkenes + acyl peroxides **14-09**
alkenes + carboxylic acids **15-06**
alkenes + carboxylic esters **15-33**
alkyl halides + carboxylate anions **10-17**
alkylation of oxazolidines **10-72**
allylic carbonates + malonates **10-60**
allylic esters + malonates **10-60**
anhydrides + alcohols **16-62**
aryl halides + alcohols + CO **13-15**
aryl halides + alcohols + metal carbonyls **13-15**
Baeyer–Villiger rearrangement **18-19**
by Favorskii rearrangement **18-07**
by Michael addition **15-24**
by the Tishchenko reaction **19-82**
carbonylation of alkyl halides and alcohols **10-77**
carboxylic acids + diazo compounds **10-19**
cleavage of keto-esters **12-43**
condensation of aldehydes **19-82**
condensation of ketones **19-84**
esterification of carboxylic acids **16-63**
esters + ethers **10-18**
ethers + anhydrides **10-18**
from acyl peroxides **14-09**
from alkyl halo sulfites **10-17**
from coupling of activated esters **10-61**
from onium salts **10-17**
from tosyl amides **10-17**
hydrolysis of ortho esters **10-06**
insertion of diazo esters **12-21**
ketones + acyl halides **16-07**
ketones + peroxides **18-19**
oxidation of methylene in ethers **19-17**
oxidation of primary alcohols **19-22**
oxidation of vinyl ethers **19-25**
oxidative decarboxylation **19-12**
oxygenation of organometallics **12-29**
rearrangement of halo ketones **18-07**
ring contraction of diazo ketones **18-08**
transesterification **16-64**
via Mitsunobu coupling **10-17**

CONJUGATED ALDEHYDES
by aldol condensation **16-34**

CONJUGATED AMIDES
isocyanates + vinyl-M (metal) **15-22**

CONJUGATED CARBOXYLIC ACIDS
aldehydes + anhydrides **16-39**
by the Knoevenagel reaction **16-38**
CO_2 + vinyl-M (metal) **15-22**

CONJUGATED DIACIDS
by the Knoevenagel reaction **16-38**

CONJUGATED DIKETONES
by the Knoevenagel reaction **16-38**

CONJUGATED ESTERS
by the Knoevenagel reaction **16-38**
Claisen condensation **16-36**

CONJUGATED KETO-ESTERS
by the Knoevenagel reaction **16-38**

CONJUGATED KETONES
alkenes + acyl halides **12-16**
by aldol condensation **16-34**
by the Pauson–Khand reaction **15-36**
carbonylation of vinyl-M (M = metal) **12-33**
coupling of dienones **15-20**
oxidation of methylene **19-17**

CONJUGATED NITRILES
by the Knoevenagel reaction **16-38**

COUMARINS
from phenols **11-11**

CUMULENES
elimination of propargylic halides **17-22**

CYANAMIDES
amines + cyanogen halides **10-54**

CYANATES, ARYL
phenols + cyanogen halides **10-08**

CYANIDES, ACYL
acyl halides + metal cyanides **16-88**

CYANO IMINES
nitroso compounds + nitriles **16-42**

CYANOAMINES
see amino-nitriles

CYANOHYDRINS
aldehydes or ketones + HCN **16-52**
aldehydes or ketones + R_3SiCN **16-52**

CYCLOBUTANES
by [2+2]-cycloaddition **15-63**
extrusion of SO_2 **17-36**

CYCLOBUTENES
ring closure of dienes **18-27**

CYCLOPROPANES
alkenes + carbenes **15-64**
alkenes + diazo esters **15-58**
by the Simmons–Smith reaction **15-64**
conjugated carbonyls + sulfur ylids **16-49**
extrusion of nitrogen from pyrazolines **17-34**
extrusion off CO from cyclobutanones **17-35**
from pyrazoles **17-34**
from pyrazolines **15-58**
rearrangement of dienes **18-39**

DIACETATES
oxidation of dicarboxylic acids **19-13**

DIALDEHYDES
alkylation reactions **10-67**

DIAMINES
aziridines + amines or ammonia **10-38**
diamination of alkenes **15-53**
from azido-amines **10-38**
reductive coupling of imines **19-76**

DIAZO COMPOUNDS
acyl halides + diazomethane **16-89**
base-induced elimination of *N*-nitroso compounds **17-33**
oxidation of hydrazones **19-06**

DIAZONIUM COMPOUNDS
active methylene compounds + sulfonyl azides **12-10**
aldehydes + sulfonyl azides **12-10**
aromatic compounds + HONO **11-05**
aryl amines + HONO **13-19**

DICARBOXYLIC ACIDS
by Michael addition **15-24**
from aryl isothiocyanates **11-21**
oxidative cleavage of cyclic alkenes **19-10**
oxidative cleavage of ketones **19-08**

DIENES
addition of alkenes to dienes **15-20**
addition of alkynes to alkynes **15-20**
allylic halides + metals **10-56**
by the Diels–Alder reaction **15-60**
by the Wittig reaction **16-44**
cleavage of cyclobutanes **15-63**
Cope rearrangement **18-32**
coupling of alkynes and allenes **15-20**
coupling vinyl boranes **14-26**
cycloaddition of dienes **15-66**
dehydration of alkyne-alcohols **17-01**
dienes + acyl metal compounds **12-16**
from aromatic compounds **18-27**
hydrogenation of aromatic compounds **15-13**
hydrogenation of diynes **15-11**
metathesis of alkenes **18-37**
other cycloaddition reactions **15-66**
pyrolysis of bicyclic alkene-ketones **17-28**
pyrolysis of sulfoxides **17-20**
rearrangement of dienes **18-32**
ring closure of trienes **18-27**
ring opening of cyclic alkenes **18-27**
sigmatropic carbon migration **18-30**
sigmatropic H migration **18-29**
Stille coupling **12-15**
vinyl halides + metals **10-56**
vinyl halides + RM (other metals) **10-59**
vinyl-X + vinyl-M **12-15**

DIESTERS
active methylene compounds + alkyl halides **10-67**
alkenes + acyloxy salts **15-56**
alkylation reactions **10-67**
dimerization of acetals **10-64**

DIHALIDES (GEMINAL)
alkenes + halogenating agents **16-23**
ketones + halogenating agents **16-23**

DIHALIDES
alkynes + HX **15-02**
dihalogenation of alkenes **15-39**
from alkyl halides + trihalides **10-57**

DIKETONES
acyl halides + active H compounds **16-84**
acylation of enamines **10-69**
alkylation reactions **10-67**
by Michael addition **15-24**
conjugate addition of acyl halides **15-32**
conjugate addition of RM with metal carbonyls **15-32**
conjugated ketones + metals **10-56**
coupling acyl halides **16-83**
dimerization of silyl enol ethers **19-33**
esters + ketones **16-86**
from dithioketals **16-86**
hydrolysis of furans **10-6**
ketones + diazo-ketones **12-21**
oxidation of alkynes **19-26**
oxidation of methylene **19-17**
oxidative cleavage of cyclic alkenes **19-10**

DINITRILES
alkylation reactions **10-67**

DIOLS
alkenes + formaldehyde **16-53**
alkenes + halogens + metal carboxylates **15-48**
by the Tollens reaction **16-43**
dihydroxylation of alkenes **15-48**
from halo-esters **15-48**
hydride shifts of epoxides **18-41**
hydrolysis of epoxides **10-7**
hydrolysis of epoxides **15-48**
ketones + formaldehyde **16-43**
oxidation of aromatic compounds **15-49**
pinacol coupling **19-76**

reduction of lactones **19-38**
reductive coupling of aldehydes or ketones **19-76**

DISULFIDES
aryl halides + sulfides **13-04**
from alkyl halides **10-27**
oxidation of thiols **19-34**
reduction of sulfonyl halides **19-71**

DITHIOACETALS
aldehydes + thiols **16-11**
from dihalides **10-26**

DITHIOCARBAMATES
amines + carbon disulfide **16-22**

DITHIOKETALS
alkylation of dithioketals **10-71**
from dithioketals **10-13**
from dithiols **10-13**
ketones + CS_2 **16-42**
ketones + thiols **16-11**
vinyl sulfides + thiols **15-07**

DITHIOLS
alkenes + sulfur reagents **15-51**

DIYNES
metal coupling of alkynes **14-16**

ENAMIDES
amines + vinyl halides **12-32**

ENAMINES
alkylation of enamines **10-71**
alkynes + amines **15-08**
from hydroxy-amines **16-13**

ENOL ETHERS : see vinyl ethers

ENOLS
and keto–enol tautomerism **12-03**

EPISULFIDES : see thiiranes

EPOXIDES
aldehydes or ketones + halo-organometallics **16-24**
diazonium compounds + aldehydes or ketones **16-46**
epoxidation of alkenes **15-50**
from halohydrins **10-9**
sulfur ylids + aldehydes or ketones **16-46**

EPOXY-ALCOHOLS
allylic alcohols + peroxides **15-50**

EPOXY-AMIDES
epoxidation of conjugated esters **15-50**

EPOXY-CARBOXYLIC ACIDS
epoxidation of conjugated acids **15-50**

EPOXY-ESTERS
diazo esters + aldehydes **15-64**
epoxidation of conjugated esters **15-50**
halo esters + aldehydes or ketones **16-40**

EPOXY-KETONES
epoxidation of conjugated ketones **15-50**

EPOXY-NITRILES
epoxidation of conjugated nitriles **15-50**

ESTER-AMIDES
isonitriles + carboxylic acids + aldehydes **16-98**
isonitriles + carboxylic acids + ketones **16-98**

ESTER-SULFIDES
by the Pummerer rearrangement **19-83**
rearrangement of sulfoxides **19-83**

ESTERS : see carboxylic esters

ESTERS, INORGANIC
from alcohols **10-22**
from sulfonyl halides **10-22**
phosphites + alkyl halides **16-44**

ETHER-AMINES
rearrangement of halo-amines **18-18**

ETHER-ESTERS
conjugated esters + alcohols **15-05**

ETHER-KETONES
acetals + vinyl ethers **10-64**
oxidation of methylene **19-15**

ETHERS
acyl peroxides + alkyl organometallics **12-26**
alcohols + diazo compounds **10-11**
alcohols + onium salts **10-15**
alcohols + sulfonate esters **10-10**
aldehydes + alcohols **16-07**
alkenes + alcohols **15-05**
alkenes-alkoxymercuration **15-05**
alkylation of ethers **10-71**
aryl halides + alkoxides **13-03**
cleavage of oxonium salts **10-49**
dehydration of alcohols **10-12**
from alcohols (Williamson ether synthesis) **10-08**
from alcohols + phenols **10-12**
from alkyl halides (Williamson ether synthesis) **10-08**
from carboxylic esters **10-10**
from dihalides **10-10**
from halo-ethers **10-08**
from halohydrins **10-09**
from lactones and organometallics **16-30**
from trichloroimidates **10-10**
ketones + alcohols **16-07**
Michael addition with *O* nucleophiles **15-31**
oxidative cyclization of alcohols **14-06**
phenols + diazo compounds **10-11**
rearrangement of aryl sulfones **13-33**
reduction of esters **19-62**
reduction of lactones **19-62**
reductive cleavage of acetals or ketals **19-56**
transetherification **10-13**

ETHERS, SILYL
Brook rearrangement **18-44**
cleavage of ethers **10-49**
rearrangement of hydroxy-silanes **18-44**

FORMAMIDES
amines + trihalides **10-40**

GLYCIDIC ESTERS : see epoxy-esters

HALIDES, ACYL
acyl halides + HF **16-80**
aldehydes + halogens **14-04**
anhydrides + HF **16-80**
carboxyl acids + halogenating agents **16-79**
oxidation of primary alcohols **19-22**

HALIDES, ALKYL
alcohols + HX **10-48**
alcohols + inorganic acid halides **10-48**
aldehydes + halo-boranes **16-23**
alkenes + alkyl halides **15-46**
alkenes + halogens **14-01**
alkenes + HX **15-02**
carboxylate salts + halogens **14-30**
cleavage of amines **10-53**
cleavage of ethers **10-49**
cleavage of oxonium salts **10-49**
from amines **10-53**
from esters **10-51**
from inorganic esters **10-47**
from silyl ethers **10-48**

from sulfonate esters **10-47**
halide exchange with alkyl halides **10-46**
halo-decarboxylation of acids **16-71**
halogens + alkyl organometallics **12-31**
halogens + boranes **12-31**
halomethylation of arenes **11-14**

HALIDES, ALLYLIC
alkanes + halo-succinimides **14-03**
alkenes + halogens **14-03**

HALIDES, ARYL
aromatic compounds + halo-succinimides **11-10**
aromatic compounds + halogen **11-10**
aryl ammonium salts + halide ion **11-32**
aryl halides + metal halides **13-07**
aryldiazonium salts + metal halides **14-20**
aryldiazonium salts + metal iodides **13-22**
from aryl amines **14-20**
from phenols **13-22**
heating aryldiazonium tetrafluoroborates **13-23**
phenols + phosphonium halides **13-07**
rearrangement of *N*-halo amides **11-31**
sulfonyl halides + transition-metal halides **11-38**

HALIDES, SULFONYL
alkanes + SO_2 + halogens **14-10**
aromatic compounds + sulfonyl halides **11-08**
aryldiazonium salts + SO_2 **14-22**
sulfonic acids + halogenating **16-103**

HALIDES, VINYL
base-induced elimination of halides **17-13**
elimination of dihalides **17-22**
from alkynes **12-31**
halide exchange with vinyl halides **10-46**
halogens + vinyl boranes **12-31**
halogens + vinyl-M (M = a metal) **12-31**

HALO-ALCOHOLS
cleavage of cyclic ethers **10-49**
from aldehydes or ketones **16-24**

HALO-ALDEHYDES
aldehydes + halogen **12-04**
aldehydes + halogenating agent **12-04**
alkenes + formamides **15-47**

HALO-ALKYNES
from alkynes **12-31**

HALO-AMIDES
amides + hypohalites **12-53**
from aziridines **10-50**

HALO-AMINES
alkenes + *N*-halo-amines **15-43**
amines + hypohalites **12-52**

HALO-AZIDES
alkenes + X—N_3 **15-45**

HALO-CARBOXYLIC ACIDS
carboxylic acid + halogen **12-05**
carboxylic acid + halogenating agents **12-05**
from amino acids **10-52**

HALO-ESTERS
from epoxides **10-50**

HALO-ETHERS
from alkene-alcohols **15-51**

HALO-KETONES
alkenes + acyl halides **15-47**

from diazoketones **10-52**
ketone + halogen **12-04**
ketone + halogenating agents **12-04**

HALO-LACTAMS
halolactamization **15-41**

HALO-LACTONES
halolactonization **15-41**

HALO-NITRO COMPOUNDS
alkenes + NOX **15-44**

HALO-NITROSO COMPOUNDS
alkenes + NOX **15-44**

HALO-SILANES
from silanes **10-16**
silanes + halogens **14-02**

HALO-SULFONES
sulfones + halogenation agents **12-06**

HALO-SULFOXIDES
sulfoxides + halogenating agents **12-06**

HALOHYDRINS
alkenes + alcohols + halogens **15-40**
alkenes + hypohalous acids **15-40**
from epoxides **10-50**

HETEROCYCLES
acylation of amines **16-77**
aromatization of six-membered rings **19-01**
by the heteroatom Diels–Alder reaction **15-61**
by the Paterno–Büchi reaction **15-63**
by [3+2]-cycloaddition **15-58**
condensation of aldehydes **16-92**
cyclization of amino-ketones or aldehydes **16-13**
cyclization of halo-amines **18-40**
dehydrogenation reactions **19-02**
dinitriles + ammonia or amines **16-21**
rearrangement of acyl aziridines **18-31**
thermal rearrangement of azides **18-14**
furans–from diketones **16-05**
indoles:Fischer indole synthesis **18-34**
oxetanes–alkenes + aldehydes or ketones **16-95**
oxetanes–alkenes + ketones **15-63**
pyrans–from diketones **16-05**
pyrazoles–hydrazines + di-ketones **16-14**
pyrazolines–alkenes + diazoalkanes **15-58**
pyrazolines–hydrazines + keto-esters **16-14**
pyridine derivatives–by the heteroatom Diels–Alder reaction **15-61**
pyrrazolidines–alkenes + azomethine imines **15-58**
pyrrolidines–cleavage of aziridines **15-58**
pyrrolines–rearrangement of cyclopropyl imines **18-31**
quinolines (dihydro)–cyclodehydration of imines **11-13**
quinolines (dihydro)–from amines **11-13**
quinolines (tetrahydro)–cyclodehydration of amides **11-13**
quinolines (tetrahydro)–from amines **11-13**

HYDRATES
from ketones or aldehydes **16-01**

HYDRAZIDES
carboxylic esters + hydrazine **16-75**

HYDRAZINES
reduction of azo compounds **19-51**
reduction of diazo compounds **19-51**

HYDRAZONES
active methylene compounds + aryldiazonium **12-07**
exchange of hydrazine + hydrazones **16-14**
from azo compounds **12-07**
from ketones **12-07**
hydrazines + aldehydes or ketones **16-14**

HYDROXAMIC ACIDS
carboxylic esters + hydroxylamine **16-75**

HYDROXY-ALDEHYDES
by aldol condensation **16-34**
dihydrooxazines + epoxides **10-72**
imines + ketones **16-34**
Mukaiyama aldol **16-35**
oxidation of epoxides **19-20**
silyl enol ethers + aldehydes **16-35**

HYDROXY-AMIDES
aldehydes + amides **16-18**
alkenes + amides **15-52**
alkenes + sulfonyl amines **15-52**

HYDROXY-AMINES
alkenes + amines **15-52**
epoxides + amines or ammonia **10-35**
from isonitriles **10-40**
from nitro-alcohols **10-35**
oxetanes + amines or ammonia **10-37**
reductive coupling of C=N with C=O **19-76**
water induced rearrangement of halo-amines **18-10**

HYDROXY-AZIRIDINES
from amino-epoxides **10-36**

HYDROXY-CARBOXYLIC ACIDS
by the Cannizzaro reaction **19-81**
rearrangement of 1,2-diketones **18-06**

HYDROXY-ESTERS
Baylis–Hillman reaction **16-27**
Claisen condensation **16-36**
epoxides + carboxylate anions **10-14**
from epoxides and RCOOH **10-18**
Reformatsky reaction **16-28**
transesterification of lactones **16-64**

HYDROXY-ETHERS
epoxides + alcohols **10-14**

HYDROXY-KETONES
acyloin condensation **19-78**
aldehydes + cyanide **16-55**
aldehydes and cyanide **15-32**
Baylis–Hillman reaction **16-27**
by aldol condensation **16-34**
by rearrangement of hydroxy ketones **18-04**
by the Tollens reaction **16-43**
coupling of carboxylic esters **19-78**
hydrolysis of diazo ketones **10-05**
ketones + formaldehyde **16-43**
Mukaiyama aldol **16-35**
oxidation epoxides **19-20**
oxidation of methylene **19-15**
photolysis of epoxy-ketones **10-07**
rearrangement of silyloxy epoxides **18-02**
reduction of epoxy ketones **19-35**
silyl enol ethers + ketones **16-35**

HYDROXY-NITRILES: see cyanohydrins

HYDROXY-NITRO COMPOUNDS
from epoxides **10-35**
the Henry reaction **16-37**

HYDROXY-PHOSPHONATES
phosphonate esters + carbonyl compounds **16-44**

HYDROXY-PHOSPHORAMIDES
phosphoramides + carbonyl compounds **16-44**

HYDROXY-THIOCYANATES
epoxides + thiocyanate **10-14**

HYDROXY-THIOETHERS
Claisen condensation **16-36**
alkenes + disulfides + carboxylic acids **15-51**
from epoxides **10-26**

HYDROXYLAMINES
addition of organometallics to oximes **16-31**
oxidation of amines **19-27**
rearrangement of amine oxides **18-21**
reduction of nitro compounds **19-46**

IMIDES
acylation of amines **16-77**
alkyl halides + imides **10-41**
anhydrides + ammonia or amines **16-73**
from alcohols **10-41**
from aryl isothiocyanates **11-21**
isocyanates + phosphine oxides **16-93**

IMIDINES
dinitriles + ammonia or amines **16-21**

IMINES
active methylene compound + nitroso compound **12-08**
addition of organometallics to nitriles **16-33**
aldehydes + amines or ammonia **16-13**
alkynes + amines **15-08**
ketones + amines or ammonia **16-13**
oxidation of primary amines **19-21**
rearrangement of cyclopropyl **18-31**
reductive alkylation of aldehydes or ketones **16-17**
thermal rearrangement of alkyl azides **18-14**

IMINO ESTERS
halo-imines + aroxides **18-42**

ISOCYANATES
amides + hypohalites **18-13**
amines + CO **12-53**
base induced rearrangement of hydroxamic acids **18-15**
carboxylic acids + HN_3 **18-16**
Curtius rearrangement **18-14**
from acyl halides **10-44**
from alkyl halides **10-44**
from nitrile oxides **18-44**
Hofmann rearrangement **18-13**
phosgene + amines **16-72**
the Schmidt reaction **18-16**
thermal rearrangement of acyl azides **18-14**

ISONITRILES (ISOCYANIDES)
alkyl halides + cyanide **10-75**
amines + trihalides **10-40**
dehydration of formamides **17-31**
from oxetanes **10-40**

ISOTHIOCYANATES
from acyl halides **10-44**
from alkyl halides **10-44**

ISOTHIOURONIUM SALTS
from alkyl halides **10-25**

KETALS
ketones + alcohols **16-05**
reductive cleavage of ortho esters **19-56**

KETENES
base-induced elimination of acyl halides **17-14**

dehydration of carboxylic acids **17-01**
elimination of halo acyl halides **17-23**

KETENIMINES
by the Wittig reaction **16-44**
dehydration of amides **17-01**

KETO-ALDEHYDES
ketals + formamides **12-16**

KETO-ALKYNES
elimination of epoxy-hydrazones **17-27**

KETO-AMIDES
alkenes + acyloxy salts + nitriles **15-56**
amino acids + anhydrides **12-42**

KETO-CARBOXYLIC ACIDS
active H compounds + CO_2 or CS_2 **16-42**
carboxylic acids + esters **16-87**

KETO-ESTERS
acyl halides + active H compounds **16-84**
aldehydes + diazoketones **12-18**
alkylation reactions **10-67**
Claisen condensation **16-85**
halo-esters + esters **16-28**
halo-esters + nitriles **16-28**

KETO-NITRILES
acyl halides + active H compounds **16-84**
by the Thorpe reaction **16-50**
condensation of nitriles **16-50**
esters + nitriles **16-86**

KETO-SULFONES
acyl halides + active H compounds **16-84**

KETO-SULFONIC ACIDS
ketone + sulfur trioxide **12-14**

KETONES
1,3-elimination of diols **17-25**
1,3-elimination of halo-amines **17-25**
1,3-elimination of halohydrins **17-25**
acyl halides + organometallic compounds **16-81**
addition of organometallics to nitriles **16-33**
aldehydes + boranes **12-18**
aldehydes + transition-metal complexes **12-18**
alkenes + aldehydes **15-34**
alkenes + alkenes + CO **15-36**
alkenes + ketones **15-33**
alkyl halides + organoiron compounds **10-76**
alkylation of enamines **10-69**
alkylation of hydrazones **10-68**
alkylation of ketones **10-68**
alkylation reactions **10-67**
amines + HONO **12-50**
and keto–enol tautomerism **12-03**
aromatic compounds + acyl halides **11-17**
aromatic compounds + aldehydes **14-19**
aromatic compounds + anhydrides **11-17**
aromatic compounds + carboxylic acids **11-17**
aromatic compounds + nitriles **11-24**
arylation of ketones **13-14**
by decarboxylation **12-40**
by Michael addition **15-24**
by Pinacol rearrangement **18-02**
by rearrangement of ketones **18-04**
by the Wacker process **19-25**
carbonyl transposition **12-14**
carbonylation of metal alkyls **13-15**
carboxylic acids + organolithium reagents **16-29**
cleavage of alkoxides **12-41**

cleavage of diketones **12-43**
conjugate addition of organometallics **15-25**
conjugated addition of boranes **15-27**
cyanoboranes + anhydrides **18-23**
decarboxylative alkylation **14-31**
decarboxylative coupling of 2 acids **16-90**
diazo ketones + boranes **10-73**
Friedel–Crafts acylation **11-17**
from cyanohydrins **10-68**
from dihydrooxazines **10-72**
from dithioketals **16-11**
from keto-sulfoxides **10-67**
halo ketones + boranes **10-73**
homologation of ketones **18-09**
hydration of alkynes **15-04**
hydration of allenes **15-04**
hydrolysis of C=N compounds **16-02**
hydrolysis of dithioketals **10-71**
hydrolysis of *gem*-dihalides **10-2**
hydrolysis of imines **16-33**
hydrolysis of ketals **10-6**
hydrolysis of nitro compounds **16-03**
hydrolysis of vinyl ethers **10-6**
hydrolysis of vinyl halides **10-1**
imines + RM **10-69**
insertion of diazo ketones **12-21**
ketenes + alkenes **15-63**
keto esters + alkyl halides **10-67**
ketones + diazomethane **18-09**
oxidation alkenes **19-25**
oxidation of alcohols **19-03**
oxidation of dicarboxylic acids **19-13**
oxidation of methylene **19-17**
oxidation of nitro compounds **19-21**
oxidation of primary amines **19-21**
oxidation of vinyl boranes **18-26**
oxidative cleavage of alkenes **19-10**
oxidative cleavage of diols **19-07**
oxidative cleavage of enamines **19-10**
ozonolysis of alkenes **19-09**
pyrolysis of hydroxy-alkenes **17-32**
radical addition to conjugated ketones **15-28**
rearrangement of diols **18-02**
rearrangement of epoxides **18-02**
rearrangement of peroxides **18-20**
reductive coupling of keto-esters **19-77**
ring expansion of amino-alcohols **18-03**
ring expansion of halohydrins **18-03**
silyl enol ethers + alkyl halides **10-68**
transesterification of vinyl esters **16-64**
transition metal carbonyls + RM (M = metal) **12-33**
Weinreb amides + organometallic compounds **16-82**

LACTAMS
alkyl halides from amides **10-41**
and Michael addition **15-31**
by Beckmann rearrangement **18-17**
cyclic ketones + HN_3 **18-16**
cyclic ketones + silyl azides **18-16**
from amino carboxylic acids **16-74**
from halo-amides **10-41**
lactams + amines **16-76**
lactones + ammonia or amines **16-75**
N-arylation **10-41**
N-vinylation **10-41**
oxidation of methylene in amines **19-17**
rearrangement of oximes **18-17**
reduction of imides **19-64**
Schmidt reaction **18-16**

LACTAMS, β
diazoketones + C=N compounds **16-96**
enamines + ketenimines **16-96**
ketones + C=N compounds **16-96**

rearrangement of hydroxy-halo-amines **18-18**

LACTONES
alkenes + carboxylic acids **15-57**
and Michael addition **15-31**
Bayer–Villiger rearrangement **18-19**
condensation of dialdehydes **19-81**
cyclization of allene carboxylic acids **15-06**
from halo-carboxylic acids **10-17**
from hydroxy-carboxylic acids **16-63**
oxidation of methylene in ethers **19-17**
photolysis of halo-amides **18-40**
rearrangement of cyclic ketones **18-19**
rearrangement of lactones **18-44**
reduction of anhydrides **19-63**

LACTONES, β
ketones + aldehydes or ketones **16-95**

NITRATES : see inorganic esters

NITRILES
aldehydes + hydroxylamines **16-16**
alkenes + HCN **15-38**
alkyl halides + cyanide **10-75**
aromatic compounds + trihalo nitriles **11-25**
aryl halides + metal cyanides **13-08**
aryl triflates + metal cyanides **11-25**
base-induced elimination of hydrazones **17-29**
by decarboxylation **12-40**
by Michael addition **15-24**
carboxylic acids + cyanogen halides **16-94**
cyanation α to active hydrogen compounds **12-19**
cyanation α to nitrogen **12-19**
cyanoborates + metal cyanide **12-34**
dehydration of amides **17-30**
dehydration of oximes **17-29**
dehydrogenation of amines **19-05**
metal cyanides + aryl organometallics **13-08**
metal cyanides + alkyl organometallics **12-34**
rearrangement of isonitriles **18-21**
reduction of nitro compounds **19-49**

NITRITES : see inorganic esters

NITRO COMPOUNDS
alkanes + alkyl nitrates **12-09**
alkanes + nitronium salts **12-09**
alkenes + nitric acid **12-09**
aryldiazonium salts + metal nitrites **14-21**
by Michael addition **15-24**
conjugated carboxylic acids + HNO_3 **14-13**
from alcohols **10-42**
from alkyl halides **10-42**
nitration of aromatic rings **11-02**
oxidation of amines **19-28**
oxidation of isocyanates **19-28**
oxidation of oximes **19-28**
rearrangement of nitro-amines **11-28**

NITRO-ALCOHOLS: see hydroxy-nitro compounds

NITRONES
from oximes **10-24**
oxidation of oximes **19-06**

NITROSO COMPOUNDS
Barton rearrangement **18-40**
nitrosation of aromatic rings **11-03**
oxidation of amines **19-27**
rearrangement of nitroso-amines **11-29**

NITROSO-AMINES
amines + HONO **12-50**

ORGANOMETALLICS
alkanes + metals **12-23**

alkanes + alkyl organometallics **12-22**
alkenes + metal hydrides **15-17**
alkyl halides + metals **12-38**
alkyl halides + alkyl organometallics **12-39**
alkynes + metal hydrides **15-17**
aryl halides + metals **11-40**
aryl halides + R-M (M = a metal) **11-40**
formation of enolate anions **12-23**
isonitriles + organolithium reagents **16-99**
metal halides + RM (M = metals) **12-36**
metalation of aromatic compounds **13-17**
metals + RM (M = metals) **12-35**
thioethers + organometallics **14-28**
transmetallation of RM + R′M′ (M = metals) **12-37**

ORTHO ESTERS
by transetherification **10-13**
carboxylic acids + alcohols **16-05**
from trihalides **10-8**

OSAZONES
hydrazines + hydroxy aldehydes or ketones **16-14**

OXIMES
alcohols + NOCl **18-40**
aldehydes or ketones + hydroxylamine **16-15**
alkenes + NOX **15-44**
aryldiazonium salts + oximes **14-23**
Barton rearrangement **18-40**
carbonyl compounds + nitrous acid **12-08**
O-alkylation of oximes **10-24**
reduction of nitro compounds **19-49**

OXONIUM SALTS
alkyl halides + ethers **10-20**

PEROXIDES
acid halides + alkyl hydroperoxides **10-21**
alkenes + oxygen **14-07**
alkenes + oxygen **15-62**
alkenes + peroxides **14-08**
alkyl halides + hydroperoxide anion **10-21**
alkyl halides + hydroperoxide anion **10-21**
acid halides + hydrogen peroxide **10-21**
anhydrides + hydrogen peroxide **10-21**
dienes + oxygen **15-62**
oxidation of carboxylic acids **19-24**
oxygen + alkyl organometallics **12-25**
oxygen + organoboranes **12-25**
photooxidation of dienes **15-62**

PHENOLS
aromatic compounds + acyl peroxides **11-26**
aromatic compounds + peroxides **14-05**
aryl halides + hydroxide **13-01**
aryl sulfonic acids + hydroxide **13-02**
aryldiazonium salts + water **13-20**
by Wallach rearrangement **18-43**
Claisen rearrangement **18-33**
Fries rearrangement **11-27**
oxidation of aromatic compounds **11-26**
oxidation of aryl borates **13-01**
oxidation of arylboronic acids **13-01**
rearrangement of allyl aryl ethers **18-33**
rearrangement of aryl esters **11-27**
rearrangement of aryl hydroxylamines **13-32**
rearrangement of dienones **18-05**

PHOSPHINES
alkenes + phosphines **15-08**
phosphines + aryl halides **13-05**
reduction of phosphine oxides **19-68**

PHOSPHONATE ESTERS : see inorganic esters

PHOSPHONIUM SALTS
alkyl halides + amines **10-31**
phosphines + ammonium salts **10-31**

PHOSPHORANES
and the Wittig reaction **16-43**

QUINONES
and dyotropic rearrangement **18-44**
oxidation of aromatic compounds **19-04**
oxidation of aromatic compounds **19-19**
oxidation of phenols **19-04**

SELENIDES
aryl halides + selenide **13-04**
from alkyl halides **10-26**

SELENOCARBONATES
from isocyanates **16-08**

SELENOETHER-ALDEHYDES
aldehyde + diselenide **12-14**

SELENOETHER-KETONES
ketone + diselenide **12-14**

SELENOXIDES
alkylation of selenoxides **10-71**

SILANES
addition of silanes to alkene **15-19**
and dyotropic rearrangement **18-44**
aryl halides + silanes **13-16**
from metalated aryls **10-55**

SULFINIC ACIDS
RM (M = a metal) + sulfonating agents **12-30**

SULFONAMIDES
addition or arylboronates to C=N **16-31**
dealkylation of sulfonamides **19-73**
reduction of acyl sulfonamides **19-64**
reduction of sulfonyl azides **19-50**
sulfonyl halides + ammonia or amines **16-102**

SULFONATE ESTERS
alkenes + sulfonic acids **15-06**
sulfonamides + alcohols **16-101**
sulfonyl halides + alcohols **16-101**

SULFONES
alkenes + sulfonyl halides **15-42**
alkyl halides + sulfinic acid salts **10-29**
alkyl halides + sulfonyl halides **10-29**
alkylation of sulfones **10-67**
alkylation of sulfones **10-71**
and Michael addition **15-31**
aromatic compounds + sulfonic acids **11-09**
aromatic compounds + sulfonyl halides **11-09**
aryl halides + sulfonate **13-04**
oxidation of sulfoxides **19-31**
oxidation of thioethers **19-31**
sulfones + organometallics **10-61**
sulfonyl halides + arylboronic acids **16-105**
sulfonyl halides + organometallics **16-105**

SULFONIC ACIDS
aryl halides + sulfonates **13-04**
hydrolysis of sulfonyl halides **16-100**
oxidation of sulfur compounds **19-30**
oxidation of thiols **19-30**
rearrangement of aryl sulfones **13-33**
reduction of sulfonyl halides **16-104**
sulfonation of aromatic compounds **11-07**

sulfonation of aromatic compounds **11-36**
sulfonation of methylene **19-16**

SULFONIUM SALTS
alkyl halides + thioethers **10-26**

SULFONYL IMINES
sulfonamides + aldehydes **16-18**

SULFOXIDES
alkylation of sulfoxides **10-67**
aromatic compounds + sulfonyl halides **11-09**
oxidation of thioethers **19-31**

TELLURIDES
from alkyl halides **10-26**

THIIRANES (EPISULFIDES)
diazo compounds + sulfur **16-48**
alkenes + sulfur reagents **15-50**
from epoxides **10-26**
from halo-ketones **10-9**
thioketones + sulfur ylids **16-48**

THIOAMIDES
amides + sulfur reagents **16-11**
amides + sulfur reagents **16-70**
from nitriles **16-04**

THIOCARBAMATES
from isocyanates **16-08**
hydrolysis of thiocyanates **16-04**

THIOCARBOXYLIC ACIDS
acyl halides + sulfur reagents **16-69**

THIOCYANATES
aryl halides + thiocyanate **13-04**
aryldiazonium salts + thiocyanate **13-21**
from alkyl halides **10-30**
from amines **10-30**

THIOESTERS
acyl halides + thiols **16-69**
esters + sulfur reagents **16-11**

THIOETHER-ALDEHYDES
aldehyde + disulfides **12-14**

THIOETHER-KETONES
enol ethers + disulfides **12-14**
ketone + disulfides **12-14**

THIOETHERS (SULFIDES)
alkenes + thiols **15-07**
aromatic compounds + sulfones **11-23**
aryl halides + alkyl sulfides **13-04**
aryldiazonium salts + sulfide **13-21**
aryldiazonium salts + thiols **13-21**
from alcohols **10-26**
from alkyl halides **10-26**
from ammonium salts **10-26**
from dihalides **10-26**
Michael addition with *S* nucleophiles **15-31**
rearrangement of sulfonium salts **18-21**
reduction of sulfones **19-72**
reduction of sulfoxides **19-72**
sulfur + alkyl organometallics **12-30**
thiols + arylboronic acids **13-04**
thiophenols + aromatic compounds **13-04**

THIOKETONES
ketones + sulfur reagents **16-11**

THIOLACTAMS
lactam + sulfur reagents **16-11**
lactones + sulfur reagents **16-11**

THIOLS
alkyl halides + hydrogen sulfide or HS^- **10-25**
aryl halides + sulfide **13-04**

aryldiazonium salts + hydrogen sulfide **13-21**
from alcohols **10-25**
hydrolysis of Bunte salts **10-28**
reduction of disulfides **19-75**
reduction of sulfonyl halides **19-71**
sulfur + alkyl organometallics **12-30**

THIOUREAS
amines + CS_2 **16-22**
isothiocyanates + amines **16-20**

TRIAZOLES
alkenes + alkyl halides **15-58**

TRIAZOLINES
alkenes + alkyl azides **15-58**

TRIENES
aromatic compounds + carbenes **15-64**
cycloaddition of dienes **15-66**
ring opening of cyclic dienes **18-27**

TRIHALIDES
acyl halides + halogenating agents **16-23**
cleavage of methyl ketones **12-44**

TRIOXANES
from aldehydes **16-92**

UREAS
amines + CO_2 **16-22**
isocyanates + amines **16-20**

VINYL ETHERS (including silyl enol ethers)

alcohol + enol ester **10-13**
alcohol + enol ether **10-13**
by the Wittig reaction **16-44**
cleavage of acetals or ketones **17-02**
form esters **16-45**
from aldehydes **12-17**
from ketones **12-17**
from phenols **10-8**
peroxides + vinyl-M (M = a metal) **12-26**
Petasis alkenylation **16-45**
Tebbe alkenylation **16-45**

VINYL PHOSPHINES
alkynes + phosphines **15-08**

VINYL SILANES
addition of silanes to alkynes **15-19**

VINYL SULFIDES
alkynes + thiols **15-07**
ketones + thiols **16-11**

VINYL SULFONES
alkynes + sulfonyl halides **15-42**
from sulfinic acid salts **10-29**

XANTHATES
carbon disulfide + alcohols **16-10**

SUBJECT INDEX

The vast use of transition metal catalysts led to limited citations of individual metals. In many cases, the term metal catalysis, or catalysts, metal is used as a general heading for several different metals. The term organometallics is used in many cases to include Grignard reagents or organolithium reagents.

α-effects, and nucleophilicity, 0495
α-methoxy-α-trifluoromethylphenyl acetic acid (MTPA), see Mosher's acid
A-S_E2 mechanism, 0528

and aminoboranes, 1433
and the Merrifield synthesis, 1433
and the Schotten-Baumann procedure, 1427
in ionic liquids, 1429
of amines with esters, catalysts for, 1435
polymer-bound, 1429
with esters, 1434, 1435
with microwaves, 1429
amines, addition, of organometallics to imines, 1331, 1332
to alkenes, 1134, 1182
to isocyanates, 1295, 1296
to isothiocyanates, 1296
to ketenes, 1050
amines, addition to nitriles, 1296
amines, alkyl halides and hexamethylenetetramine, 0558
amines, alkylation, 0555, 0558, 0562
Delépine reaction, 0558
amines, allylic, carbanions, alkylation, 0641
formation of conjugated amides, 0851
amines, amination of alkenes, 1045, 1047
amines, and carbamate formation, 0542
and carbonylation, 1139
and cleavage of methyl ether, 0561
and cyanamide, 0559
and differential hydration, 0391
and formaldehyde, 0730
and Gabriel synthesis, 0556
and guanidine, 0570
and hydrazine, 0569
and Katritzky pyrylium-pyridinium method, 0554
and leaving groups, 0498
and lithium, reductive cleavage of carboxylic esters, 1834
and Mentshutkin reaction, 0555
and metal catalyzed amination of alkynes, 1048
and nitrous acid, 0499
and organolithium reagents, 0799
and phase transfer, 0559
and proton transfer, 0368
and pyramidal inversion, 0142, 0144
and racemization, 0144
and resonance, 0383
and the Bruylants reaction, 0614
and the Hinsberg test, 1474
and the Mannich reaction, 1292–1295
and the Mitsunobu reaction, 0559
and the Staudinger reaction, 1822
and the von Braun reaction, 0586
and transamidation, 1425
amines, aromatic or aryl, see aniline
amines, arylation with arylboronic acids, 0879
and microwaves, 0877
and the Gabriel synthesis, 0879
bicyclic, by amination of alkenes, 1048
bridgehead, and chirality, 0144
amines, by base induced rearrangement of ammonium salts, 1621
by catalytic hydrogenation of nitriles, 1814
by Hofmann rearrangement, 1607
by hydrogenation of enamines, 1049
by hydrolysis of cyanamides, 1269
by hydrolysis of isocyanates, 1607
by metal reduction of hydroxylamines, 1819
by metal reduction of nitro compounds, mechanism, 1818
by oxidation of hydrocarbons or methylene, 1757
by reduction of amides, reagents, 1810, 1841
by reduction of amine oxides, reagents, 1846
by reduction of azides, 0561, 1822
by reduction of azo or azoxy compounds, 1823, 1853
by reduction of C=N compounds, 1811, 1812
by reduction of diazonium salts, 1823
by reduction of enamines, 1813
by reduction of hydrazo compounds, 1853
by reduction of hydrazones, 1811, 1820
by reduction of imides, 1842
by reduction of imines, 1811–1813
by reduction of isocyanates, 1823
by reduction of isothiocyanates, 1823
by reduction of nitriles, reagents, 1813, 1814
by reduction of nitrilium ions, 1814
by reduction of nitro compounds, with metals in acid, 1816
by reduction of nitroso compounds, 1823
by reduction of oximes, reagents, 1812, 1819, 1820
by reduction of quaternary ammonium salts, 1844

amines, (*Continued*)
by reduction of Schiff bases, 1811
by reduction of semicarbazones, 1820
by reduction of sulfonamides, 1844
by reduction to hydrocarbons, reagents, 1843, 1844
by reduction, of iminium salts, 1812
by reductive alkylation, 1288–1291
by reductive amination with aldehydes or ketones, 1288–1291
by silane reduction of amides, 1841
by Stevens rearrangement, 1621
amines, carbene insertion, 0804
carbonylation, 0654, 0655, 0850, 0851
catalytic of enolate anion formation, 0779
chiral, and Mannich reactions, 1295
chiral, from formamidines, 0641
chloro, from amines, 0849
conjugate addition, enantioselectivity, 1132
conjugate addition, to thio-lactams, 1130
cyanation of, 0802
amines, cyclic, α-oxidation to lactams, 1759
aminyl-radical cyclization, 0559
by conjugate addition of amines, 1130
by reduction of lactams, 1842
by S_N2' reaction, 0557
cleavage with cyanogen bromide, 0587
from alkene-amines, 0557
from diols, 0560
from haloamines, 0557, 1695
ring expansion, and carbonylation, 0851
von Braun reaction, 0587'
amines, cycloalkyl, with nitrous acid, 1588
cyclobutyl, from [2 + 2]-cycloaddition, 1223
dealkylation, reagents, 1852
deamination, indirect methods, 1844
deamination, reagents, 1843, 1844
dehydrogenation to nitriles, reagents for, 1729, 1730
demethylation, 0550
diazotization, and rearrangements, 1566
diazotization, with alkyl nitrites, 0921
dicarbonyl, as nucleophiles, 0514
ditosyl, with halide ions, 0586
energy barrier to pyramidal inversion, 0142, 0144
exhaustive alkylation, 0556
formation of alcohols, 0547
formation of onium salts, 0376
formation of Schiff bases, 1282
amines, from addition of amines to alkenes, 1045
from addition of ammonia to alkenes, 1045

Z/E nomenclature, definition, 0183
Zaitsev's rule, and alkene stability, 1497
and dehydration of alcohols, 1513
and E1 reactions, 1487
and E2 reactions, 1482
and E2C reactions, 1501
and Hofmann degradation, 1522
and pyrolytic elimination, 1511
and rearrangement of alkenes, 0767
elimination reactions, failure of, 1498
Wagner-Meerwein rearrangement, 1581

zeolites, and addition of thiols to alkenes, 1043
and carbocation formation, 0248
and catalytic hydrogenation, 1057
and conjugate addition, 1108
and conversion of aldehydes to nitriles, 1288
and Diels Alder reactions, 1199
and ene reactions, 1105
and esterification, 1415
and esterification of carboxylic acids, 1418
and Friedel-Crafts acylation, 0720
and halogenation of aromatic compounds, 0702
and Meerwein-Ponndorf-Verly reduction, 1796
and Michael addition, 1108
and oxidation of alcohols, 1717
and oxidation of tetrahydropyranyl ethers, 1720
Knoevenagel reaction, 1359
Ziegler alkylation, 0913
Ziegler catalysts, coupling alkenes to alkenes, 1091
zigzag acenes, 0088
zinc and reduction of phenols the aromatic compounds, 1830
zinc chloride, and the Fischer indole synthesis, 1674
zinc cyanide, and Gatterman reaction, 0725
zinc, activated, and the Reformatsky reaction, 1327
and dehalogenation of acyl halides to ketenes, 1540
and elimination of dihalides to alkenes, 1539
and elimination of halo ethers to alkenes, 1541
and reduction of disulfides, 1853
and reduction of nitro compounds, 1821
and reduction of nitro compounds to hydroxylamines, 1818
in acid, and reduction of nitro compounds, 1815
zinc-amalgam and Wolff-Kishner reduction, 1835
Zinin reduction, 1816
zip reaction, 1438
zirconium, and Schwartz's reagent, 1083
zusammen, and alkene nomenclature, 0183
zwitterion intermediates, and elimination of hydroxy acids, 1544
zwitterions, and oxime formation, 1287
